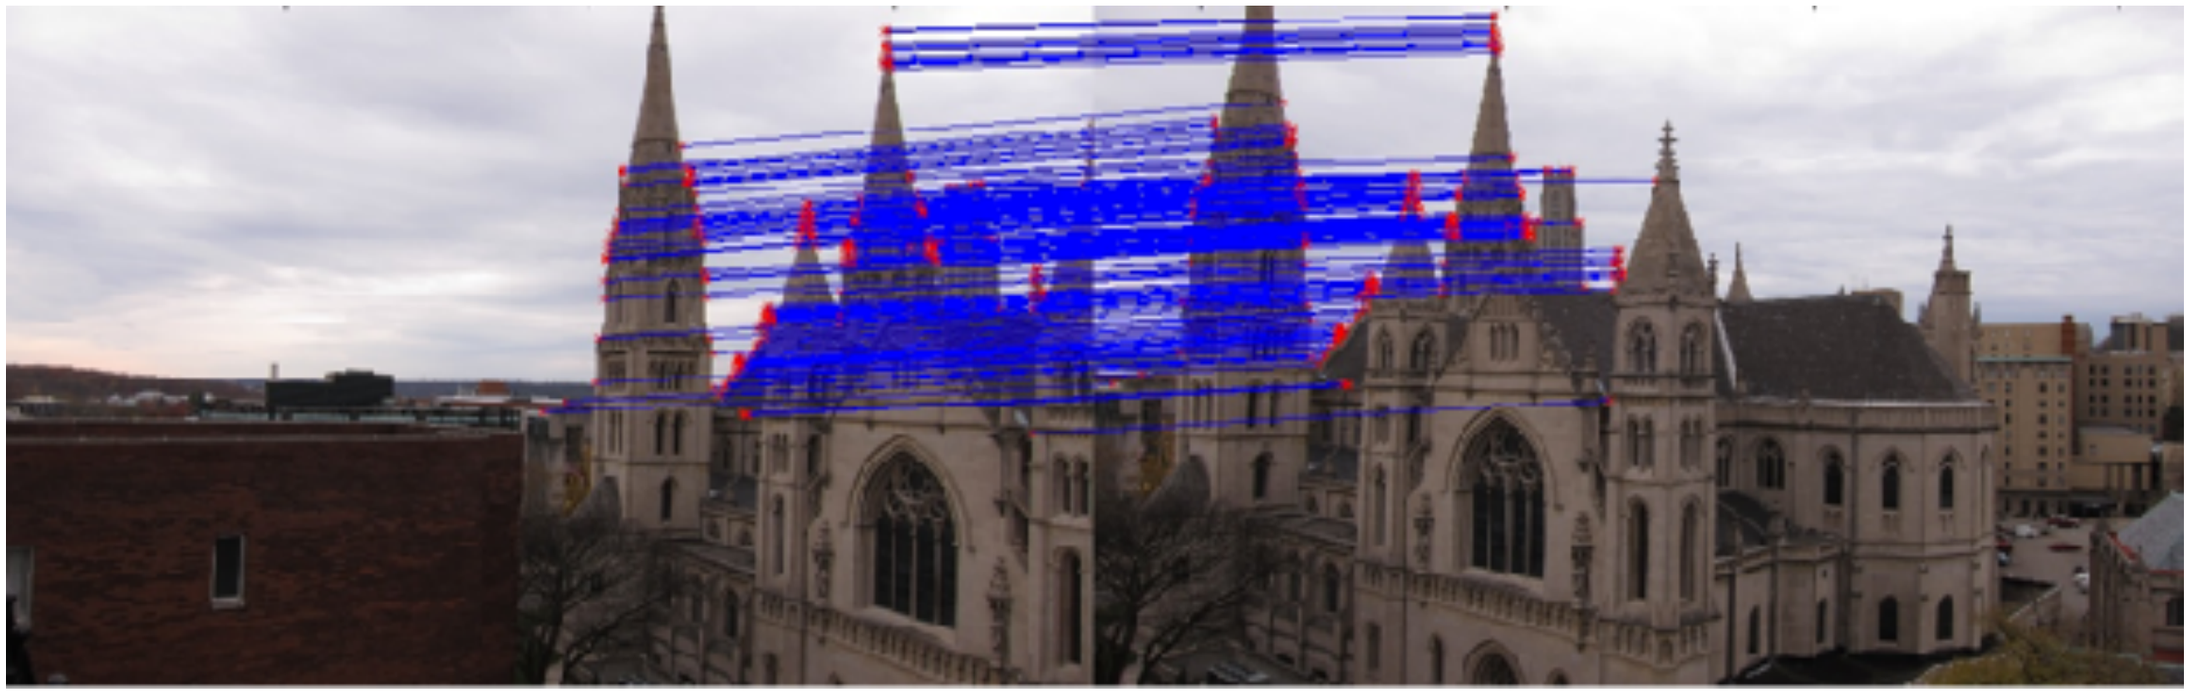
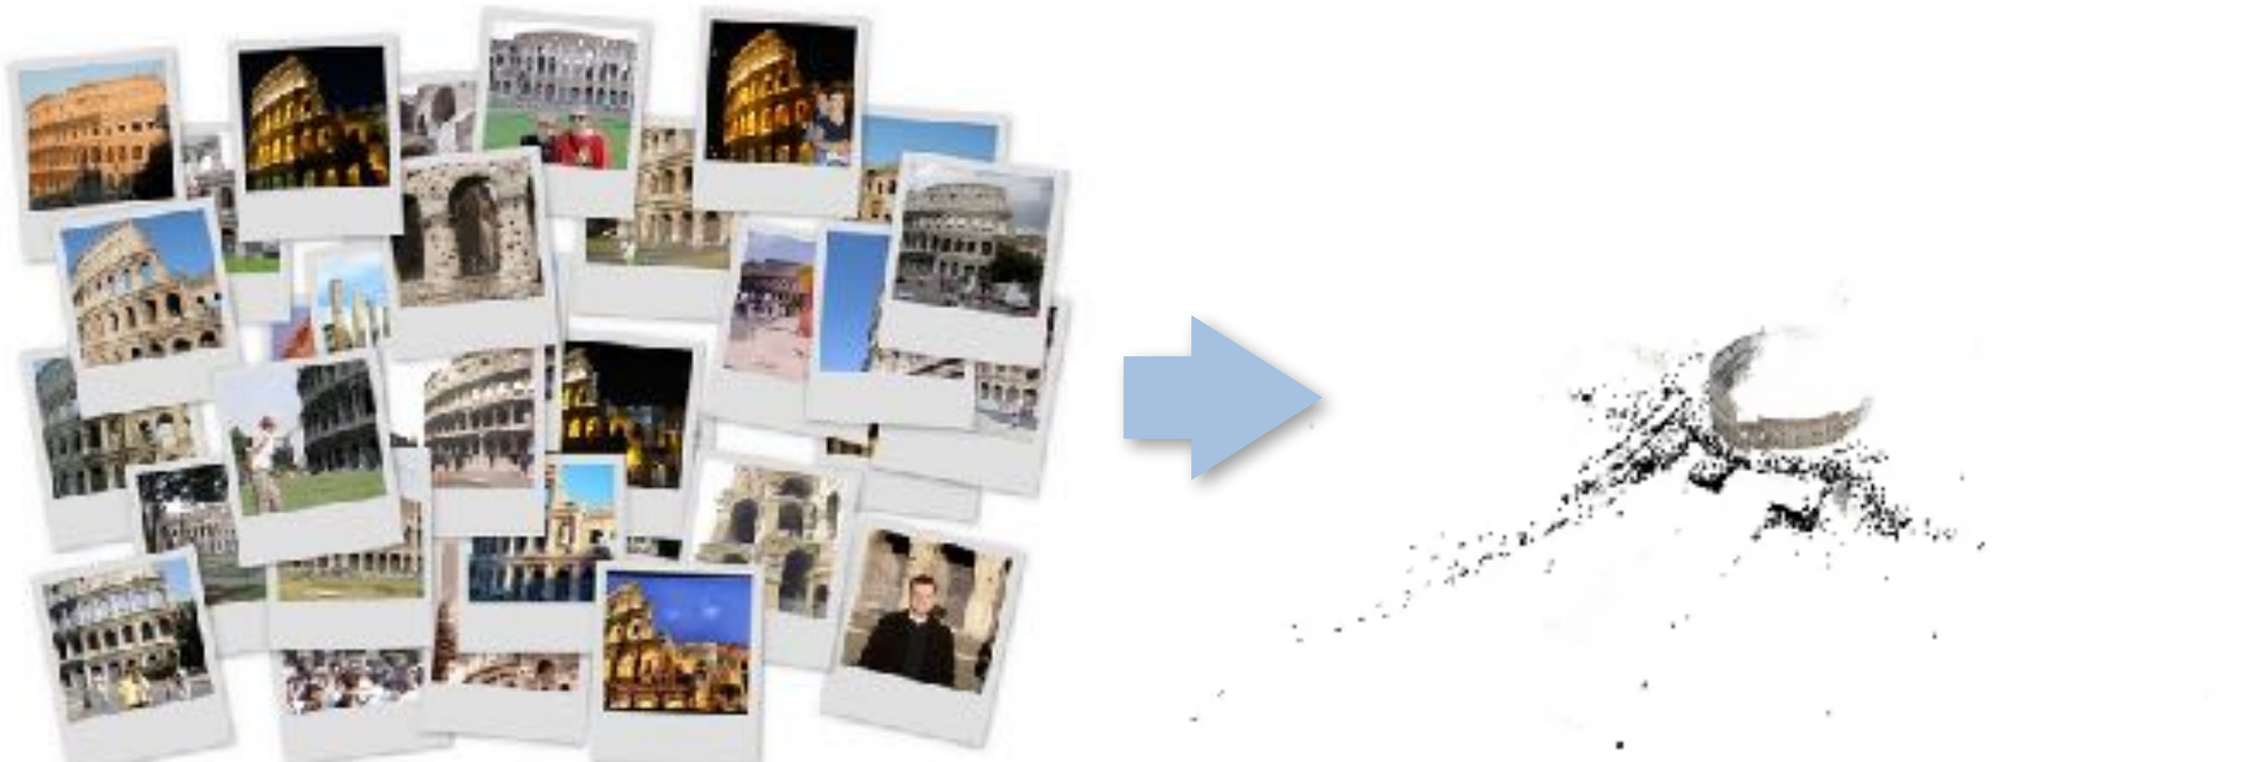
Core visual understanding task: finding correspondences between images



Source: Deva Ramanan

Example: image matching of landmarks

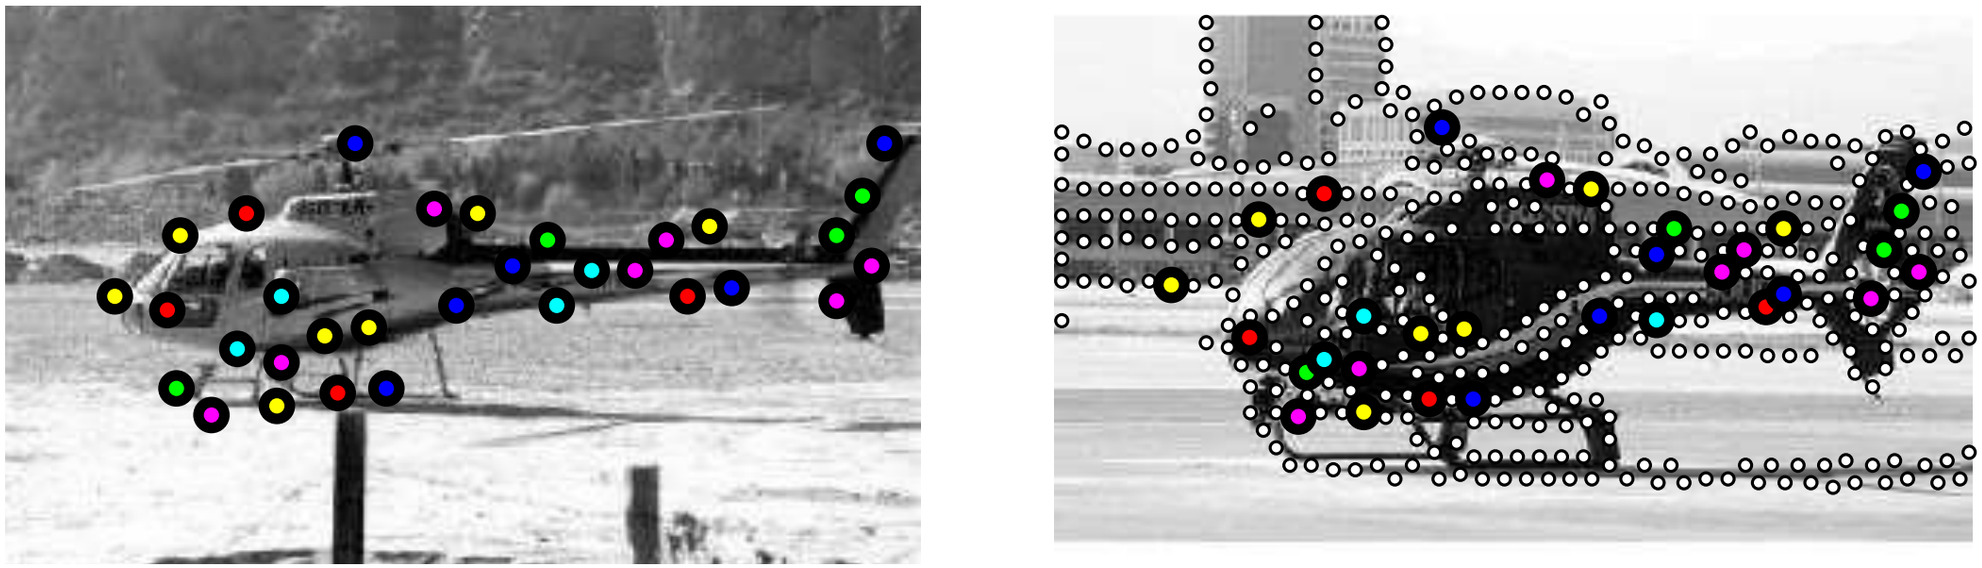


Correspondence + geometry estimation

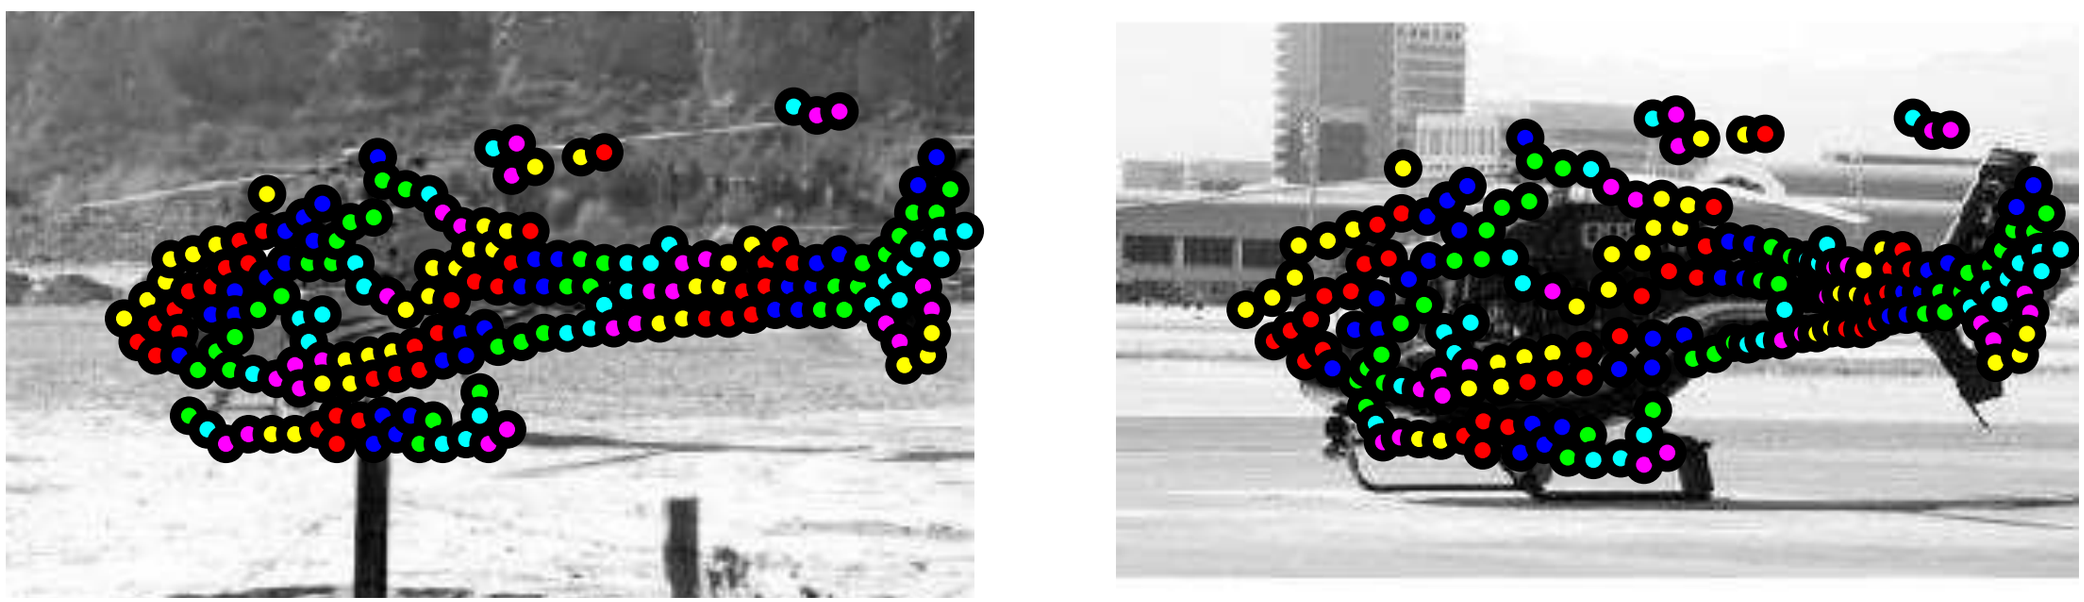
Source: Deva Ramanan

Object recognition by matching

Sparse correspondence



Dense corrrespondence

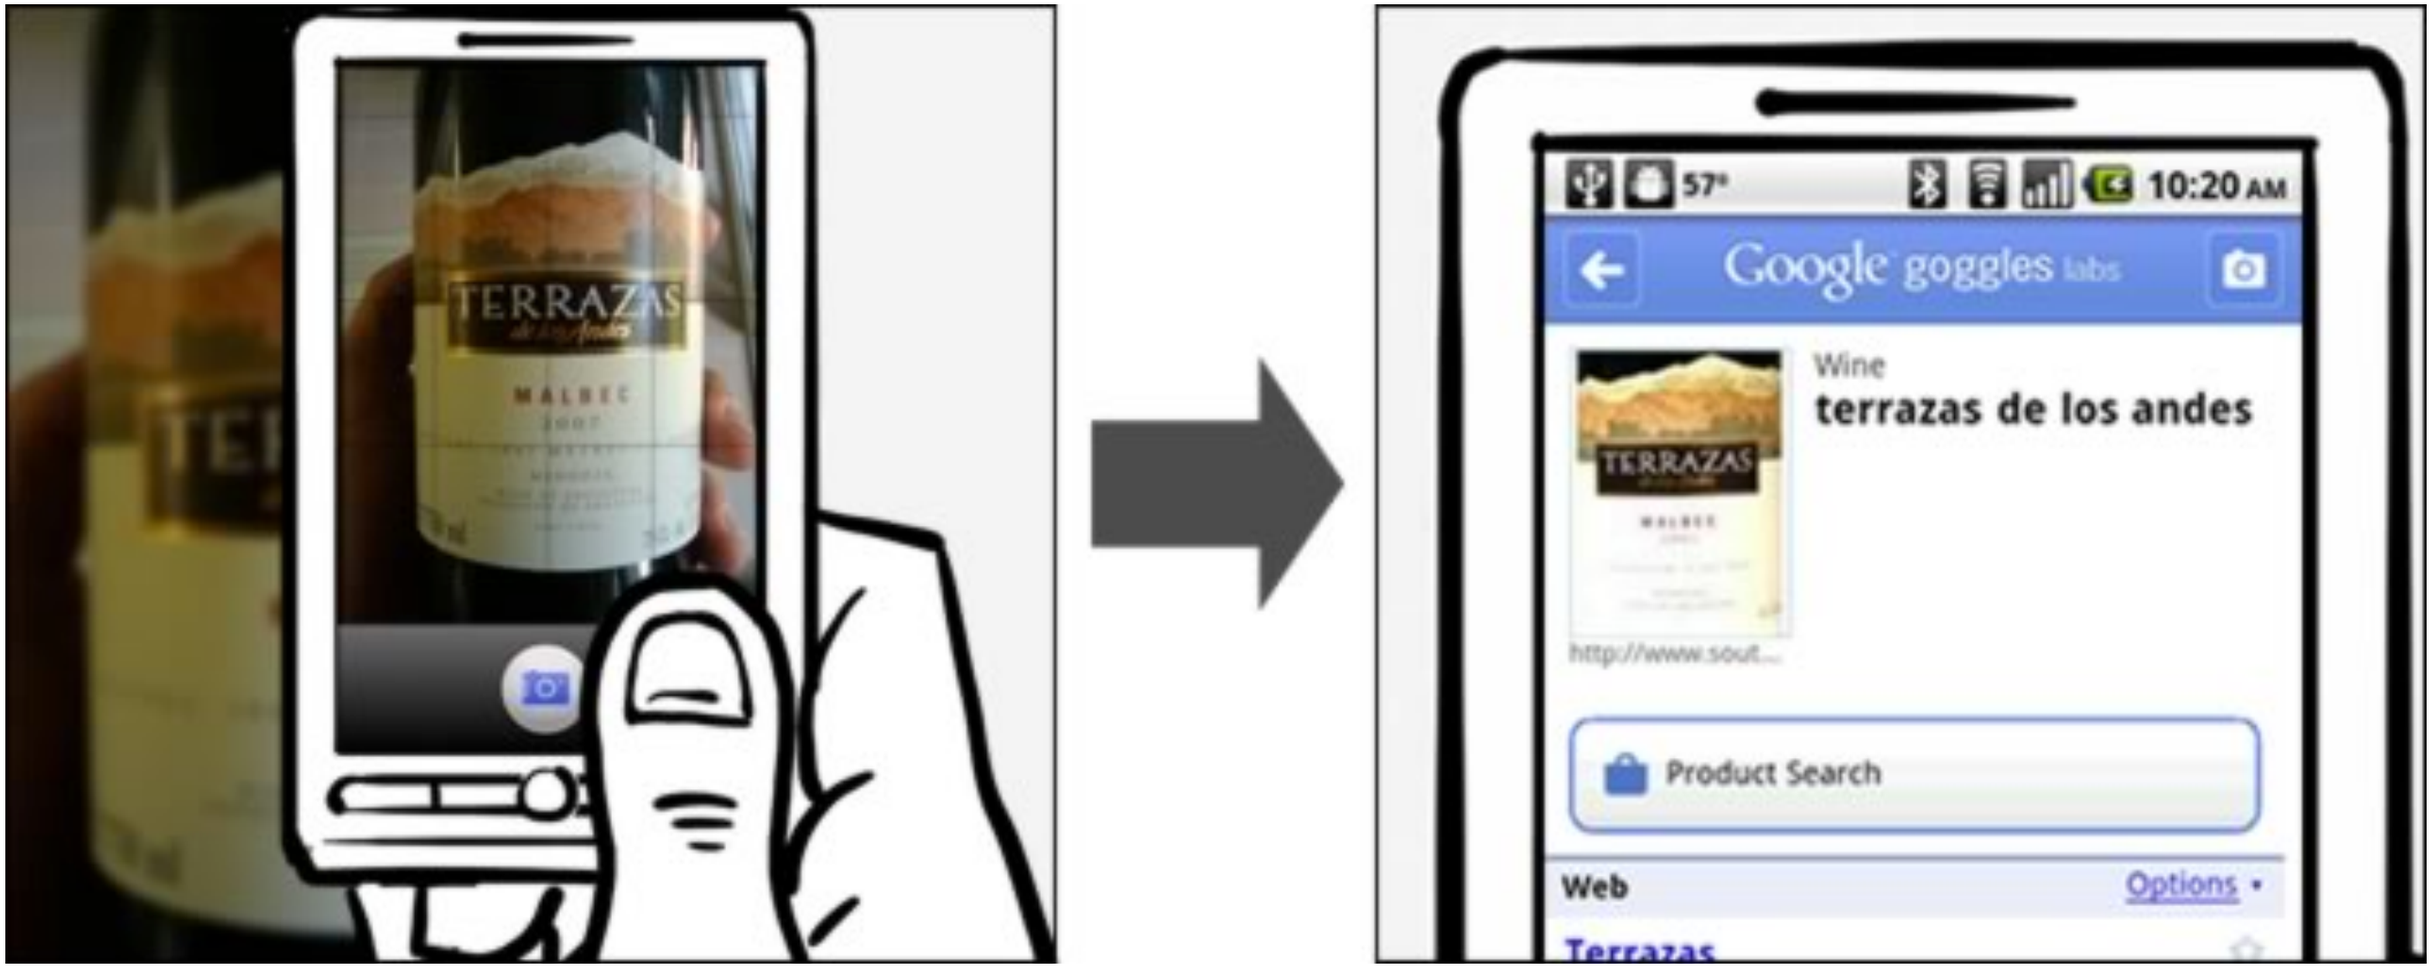


Source: Deva Ramanan

Example: license plate recognition

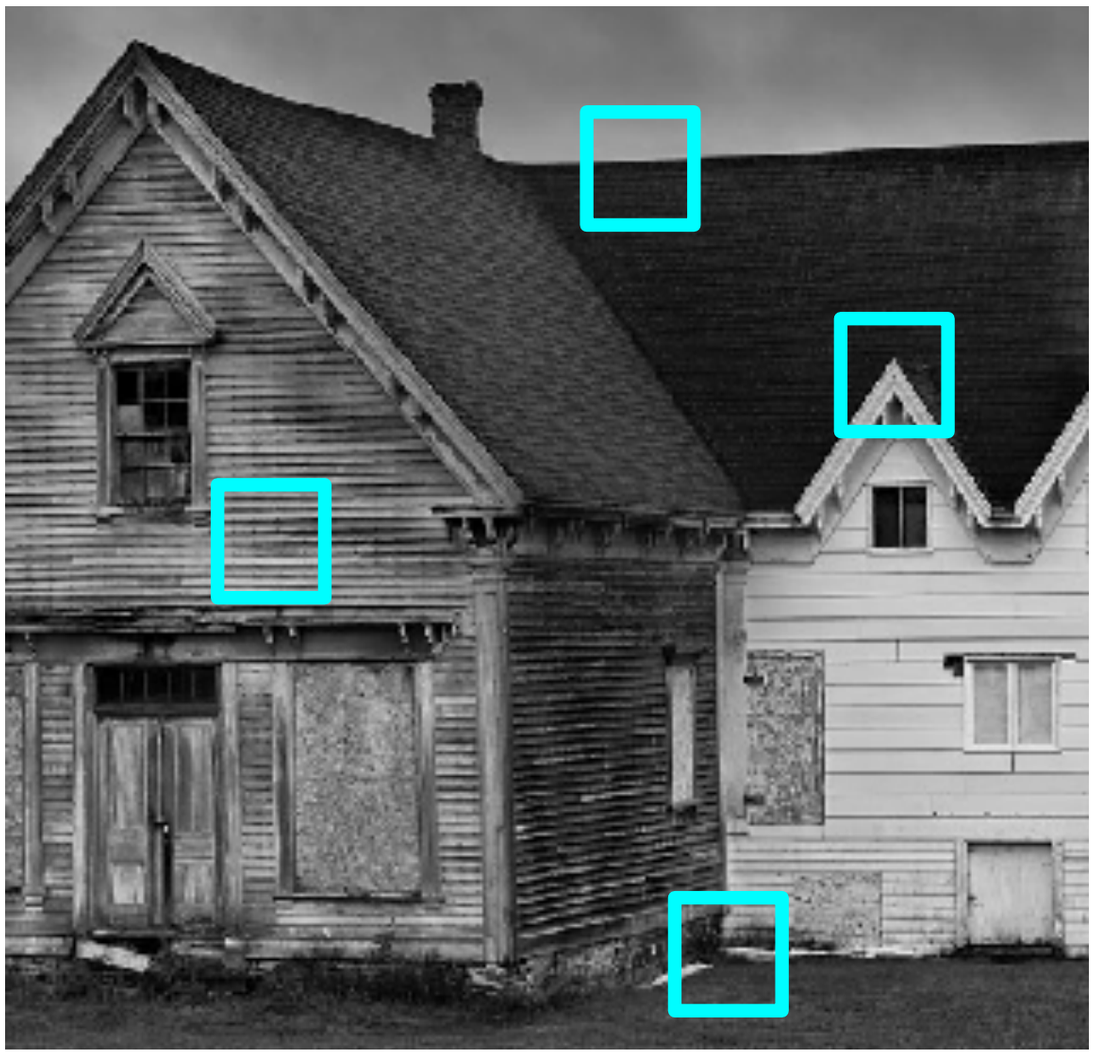
Source: Deva Ramanan

Example: product recognition



Source: Deva Ramanan

Motivation

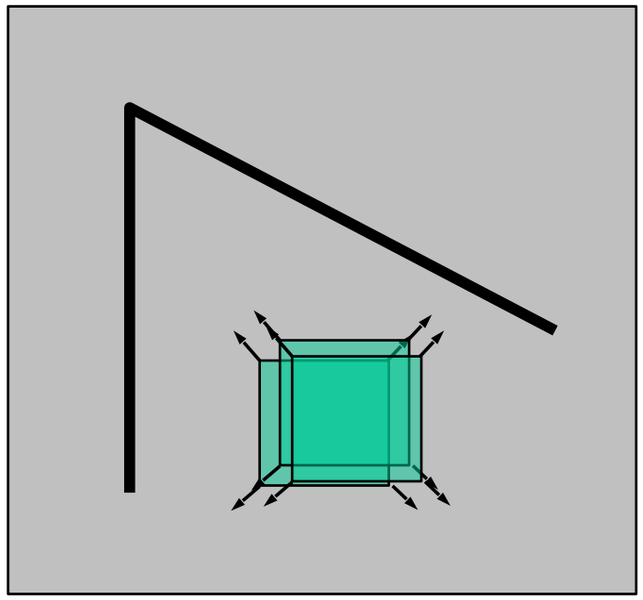


Which of these patches are easier to match?

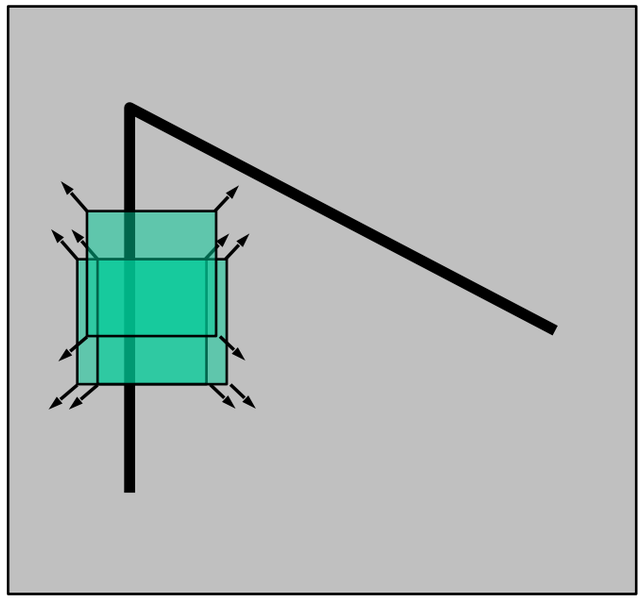
Why? How can we mathematically operationalize this?

Source: Deva Ramanan

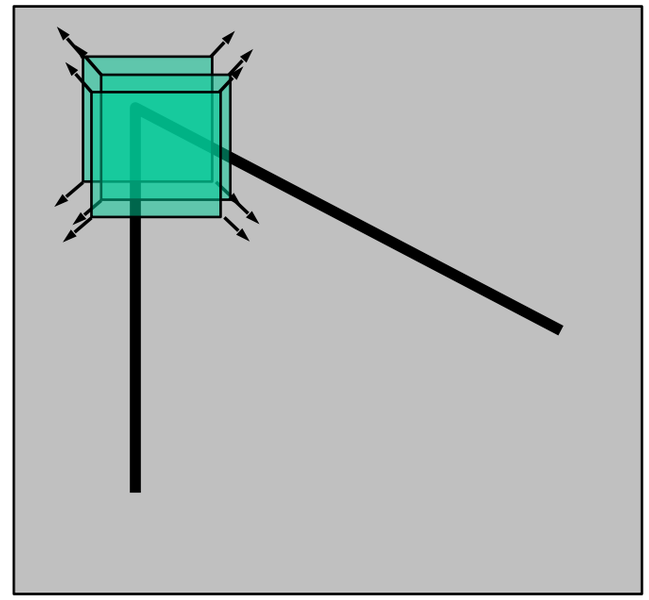
Corner Detector: Basic Idea



“flat” region:
no change in any direction



“edge”:
no change along the edge direction



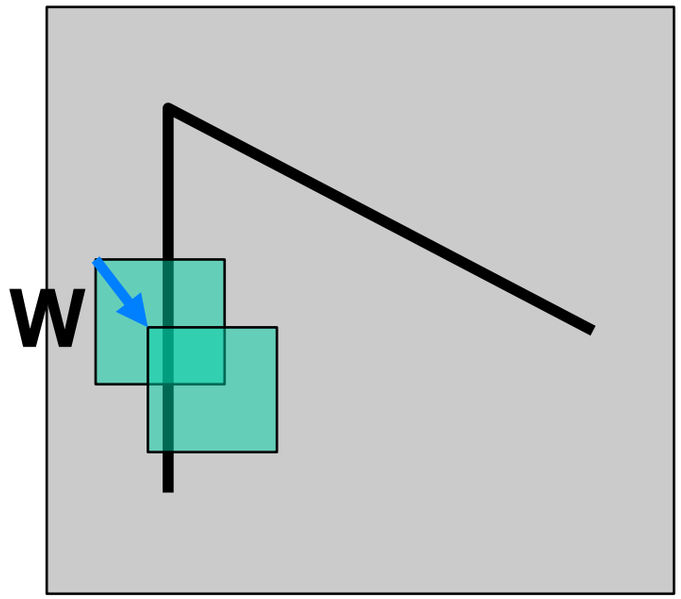
“corner”:
significant change in all directions

Defn: points are “matchable” if small shifts always produce a large SSD error

Source: Deva Ramanan

The math

Defn: points are “matchable” if small shifts always produce a large SSD error

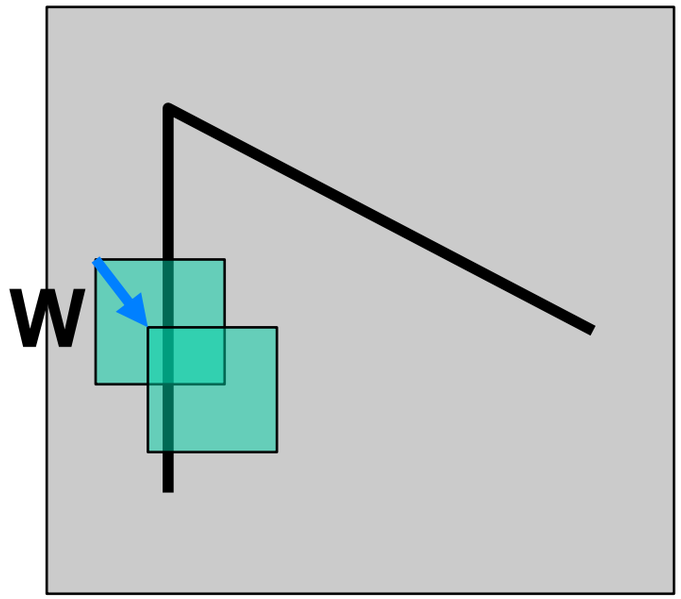


$$E_{x_0,y_0}(u,v) = \sum_{(x,y)\in W(x_0,y_0)} [I(x+u,y+v) - I(x,y)]^2$$

Source: Deva Ramanan

The math

Defn: points are “matchable” if small shifts always produce a large SSD error



$$\text{cornerness}(x_0, y_0) = \min_{u,v} E_{x_0,y_0}(u, v)$$

where

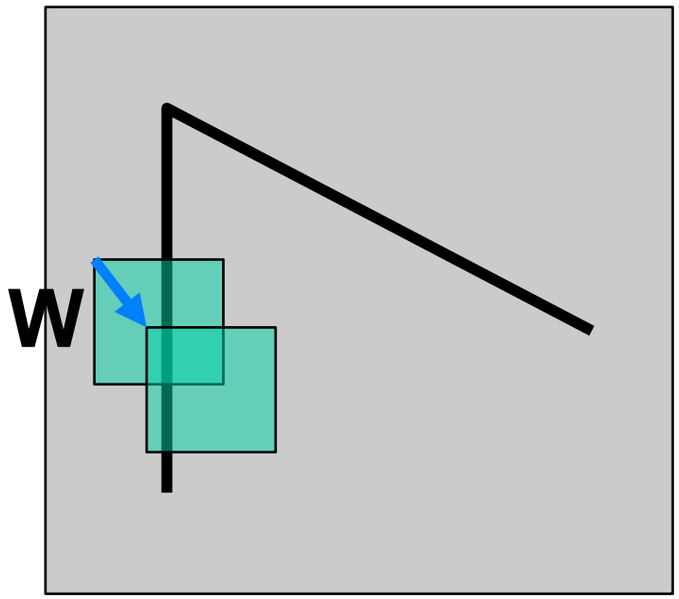
$$E_{x_0,y_0}(u, v) = \sum_{(x,y)\in W(x_0,y_0)} [I(x + u, y + v) - I(x, y)]^2$$

Why can’t this be right?

Source: Deva Ramanan

The math

Defn: points are “matchable” if small shifts always produce a large SSD error



$$\text{cornerness}(x_0, y_0) = \min_{u^2 + v^2 = 1} E_{x_0,y_0}(u, v)$$

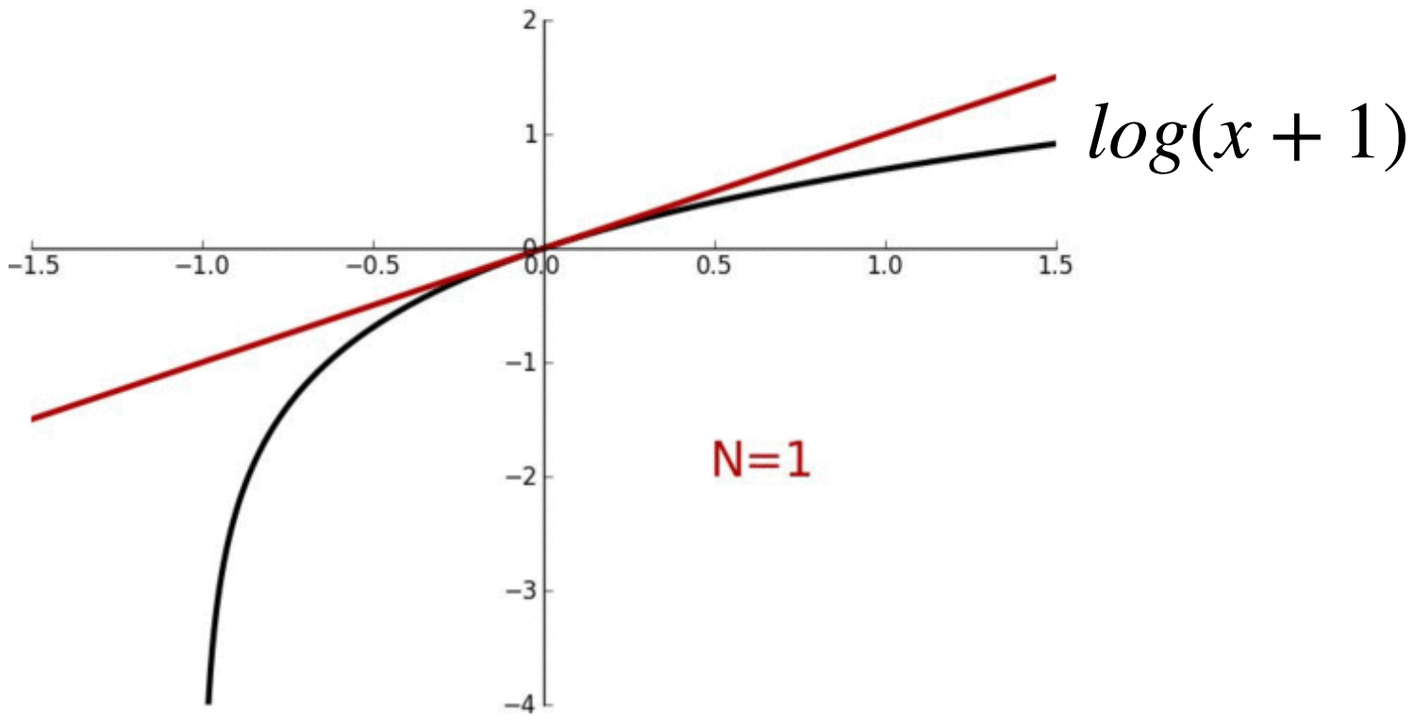
where

$$E_{x_0,y_0}(u, v) = \sum_{(x,y) \in W(x_0,y_0)} [I(x + u, y + v) - I(x, y)]^2$$

Source: Deva Ramanan

Background: taylor series expansion

$$f(x+u) = f(x) + \frac{\partial f(x)}{\partial x}u + \frac{1}{2}\frac{\partial f(x)}{\partial xx}u^2 + \text{Higher Order Terms}$$



$log(x+1)$

Why are low-order expansions reasonable?
Underyling smoothness of real-world signals

Source: Deva Ramanan

Multivariate taylor series

$$I(x+u, y+v) = I(x,y) + \begin{bmatrix} \frac{\partial I(x,y)}{\partial x} & \frac{\partial I(x,y)}{\partial y} \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} +$$

gradient

$$\frac{1}{2} \begin{bmatrix} u & v \end{bmatrix} \begin{bmatrix} \frac{\partial I(x,y)}{\partial xx} & \frac{\partial I(x,y)}{\partial xy} \\ \frac{\partial I(x,y)}{\partial xy} & \frac{\partial I(x,y)}{\partial yy} \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} + \text{Higher Order Terms}$$

Hessian

$$I(x+u, y+v) \approx \mathbf{I} + \mathbf{I}_x u + \mathbf{I}_y v$$

where

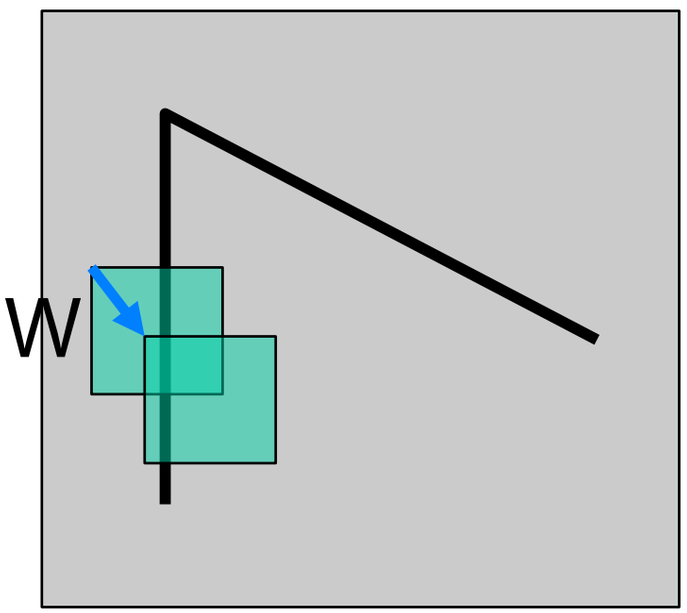
$$\mathbf{I}_x = \frac{\partial I(x,y)}{\partial x}$$

Source: Deva Ramanan

Feature detection: the math

Consider shifting the window W by (u,v)

- how do the pixels in W change?
- compare each pixel before and after by summing up the squared differences
- this defines an "error" of E(u,v):



$$
\begin{aligned}
E(u,v) &= \sum_{(x,y)\in W} [I(x+u, y+u) - I(x,y)]^2 \\
&\approx \sum_{(x,y)\in W} [\mathbf{I} + \mathbf{I}_x u + \mathbf{I}_y v - \mathbf{I}]^2 \\
&= \sum_{(x,y)\in W} [\mathbf{I}_x^2 u^2 + \mathbf{I}_y^2 v^2 + 2\mathbf{I}_x \mathbf{I}_y uv] \\
&= \begin{bmatrix} u & v \end{bmatrix} A \begin{bmatrix} u \\ v \end{bmatrix}, \quad A = \sum_{(x,y)\in W} \begin{bmatrix} \mathbf{I}_x^2 & \mathbf{I}_x\mathbf{I}_y \\ \mathbf{I}_y\mathbf{I}_x & \mathbf{I}_y^2 \end{bmatrix}
\end{aligned}
$$

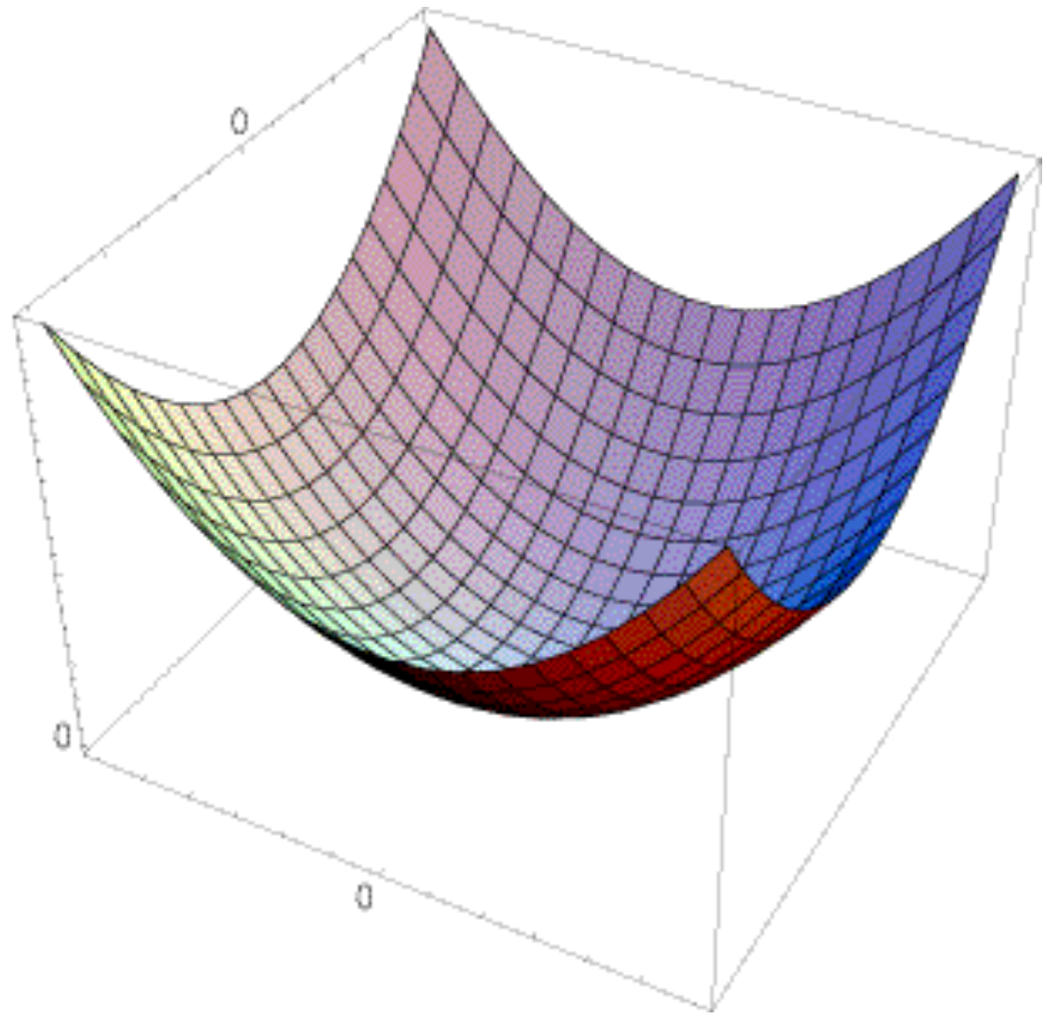
Source: Deva Ramanan

Interpreting the second moment matrix

The surface $E(u,v)$ is locally approximated by a quadratic form. Let's try to understand its shape.

$$E(u,v) \approx \begin{bmatrix} u & v \end{bmatrix} A \begin{bmatrix} u \\ v \end{bmatrix}$$

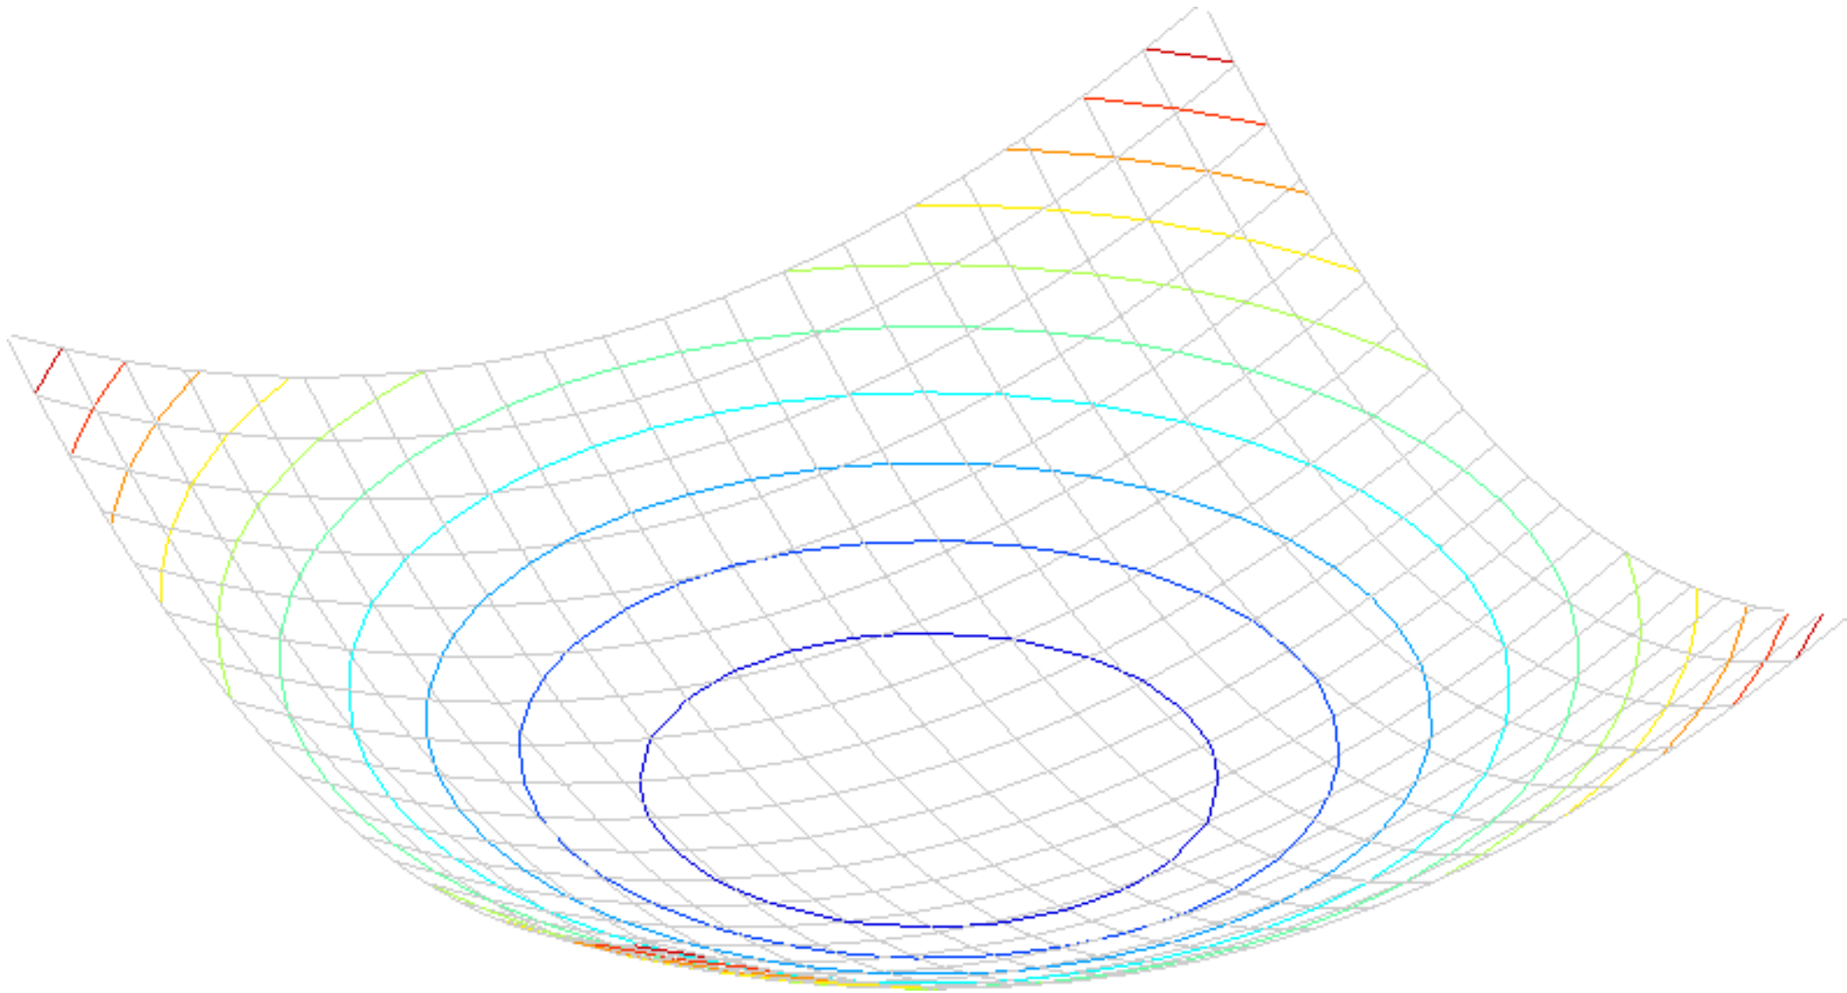
$$A = \sum_{(x,y)\in W} \begin{bmatrix} I_x^2 & I_x I_y \\ I_x I_y & I_y^2 \end{bmatrix}$$



Interpreting the second moment matrix

Consider a horizontal "slice" of $E(u, v)$: $\begin{bmatrix} u & v \end{bmatrix} A \begin{bmatrix} u \\ v \end{bmatrix} = \text{const}$

This is the equation of an ellipse.



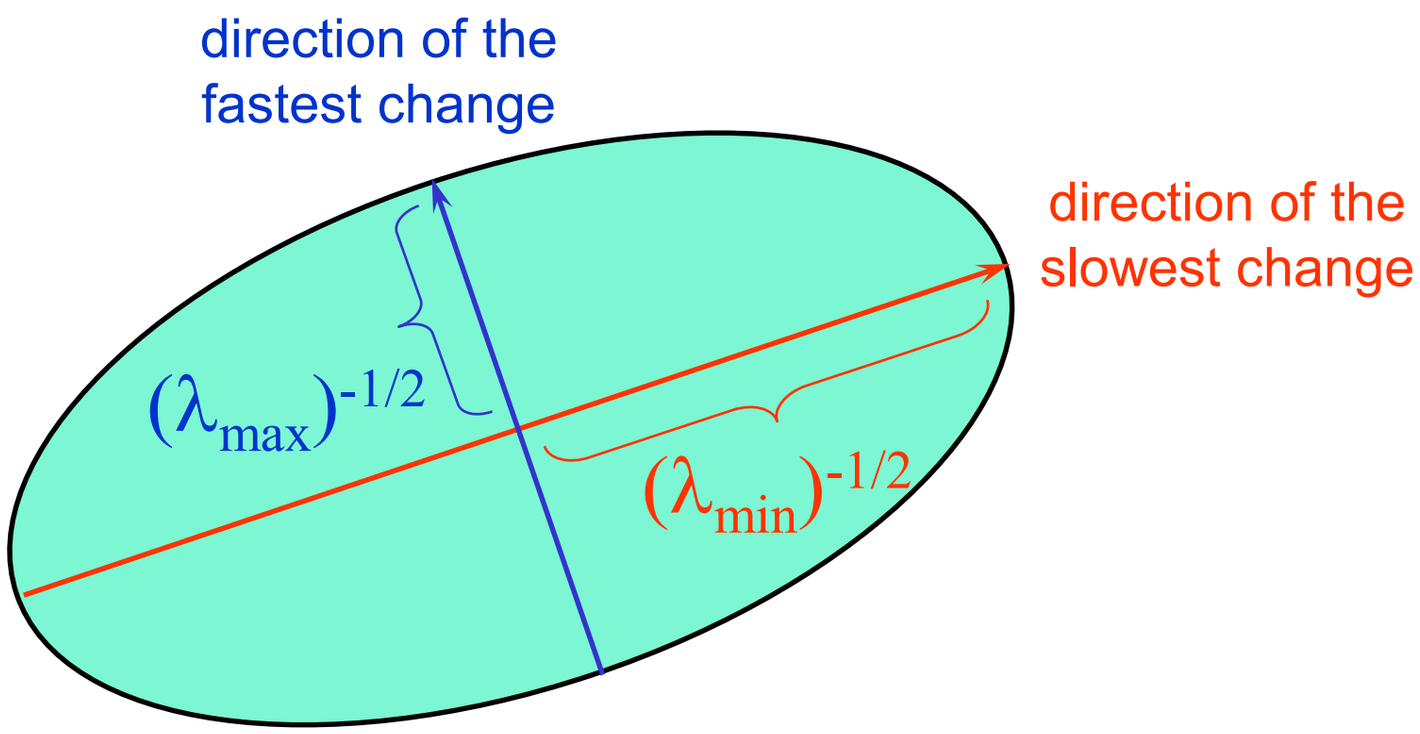
Interpreting the second moment matrix

Consider a horizontal "slice" of $E(u, v)$: $\begin{bmatrix} u & v \end{bmatrix} A \begin{bmatrix} u \\ v \end{bmatrix} = \text{const}$

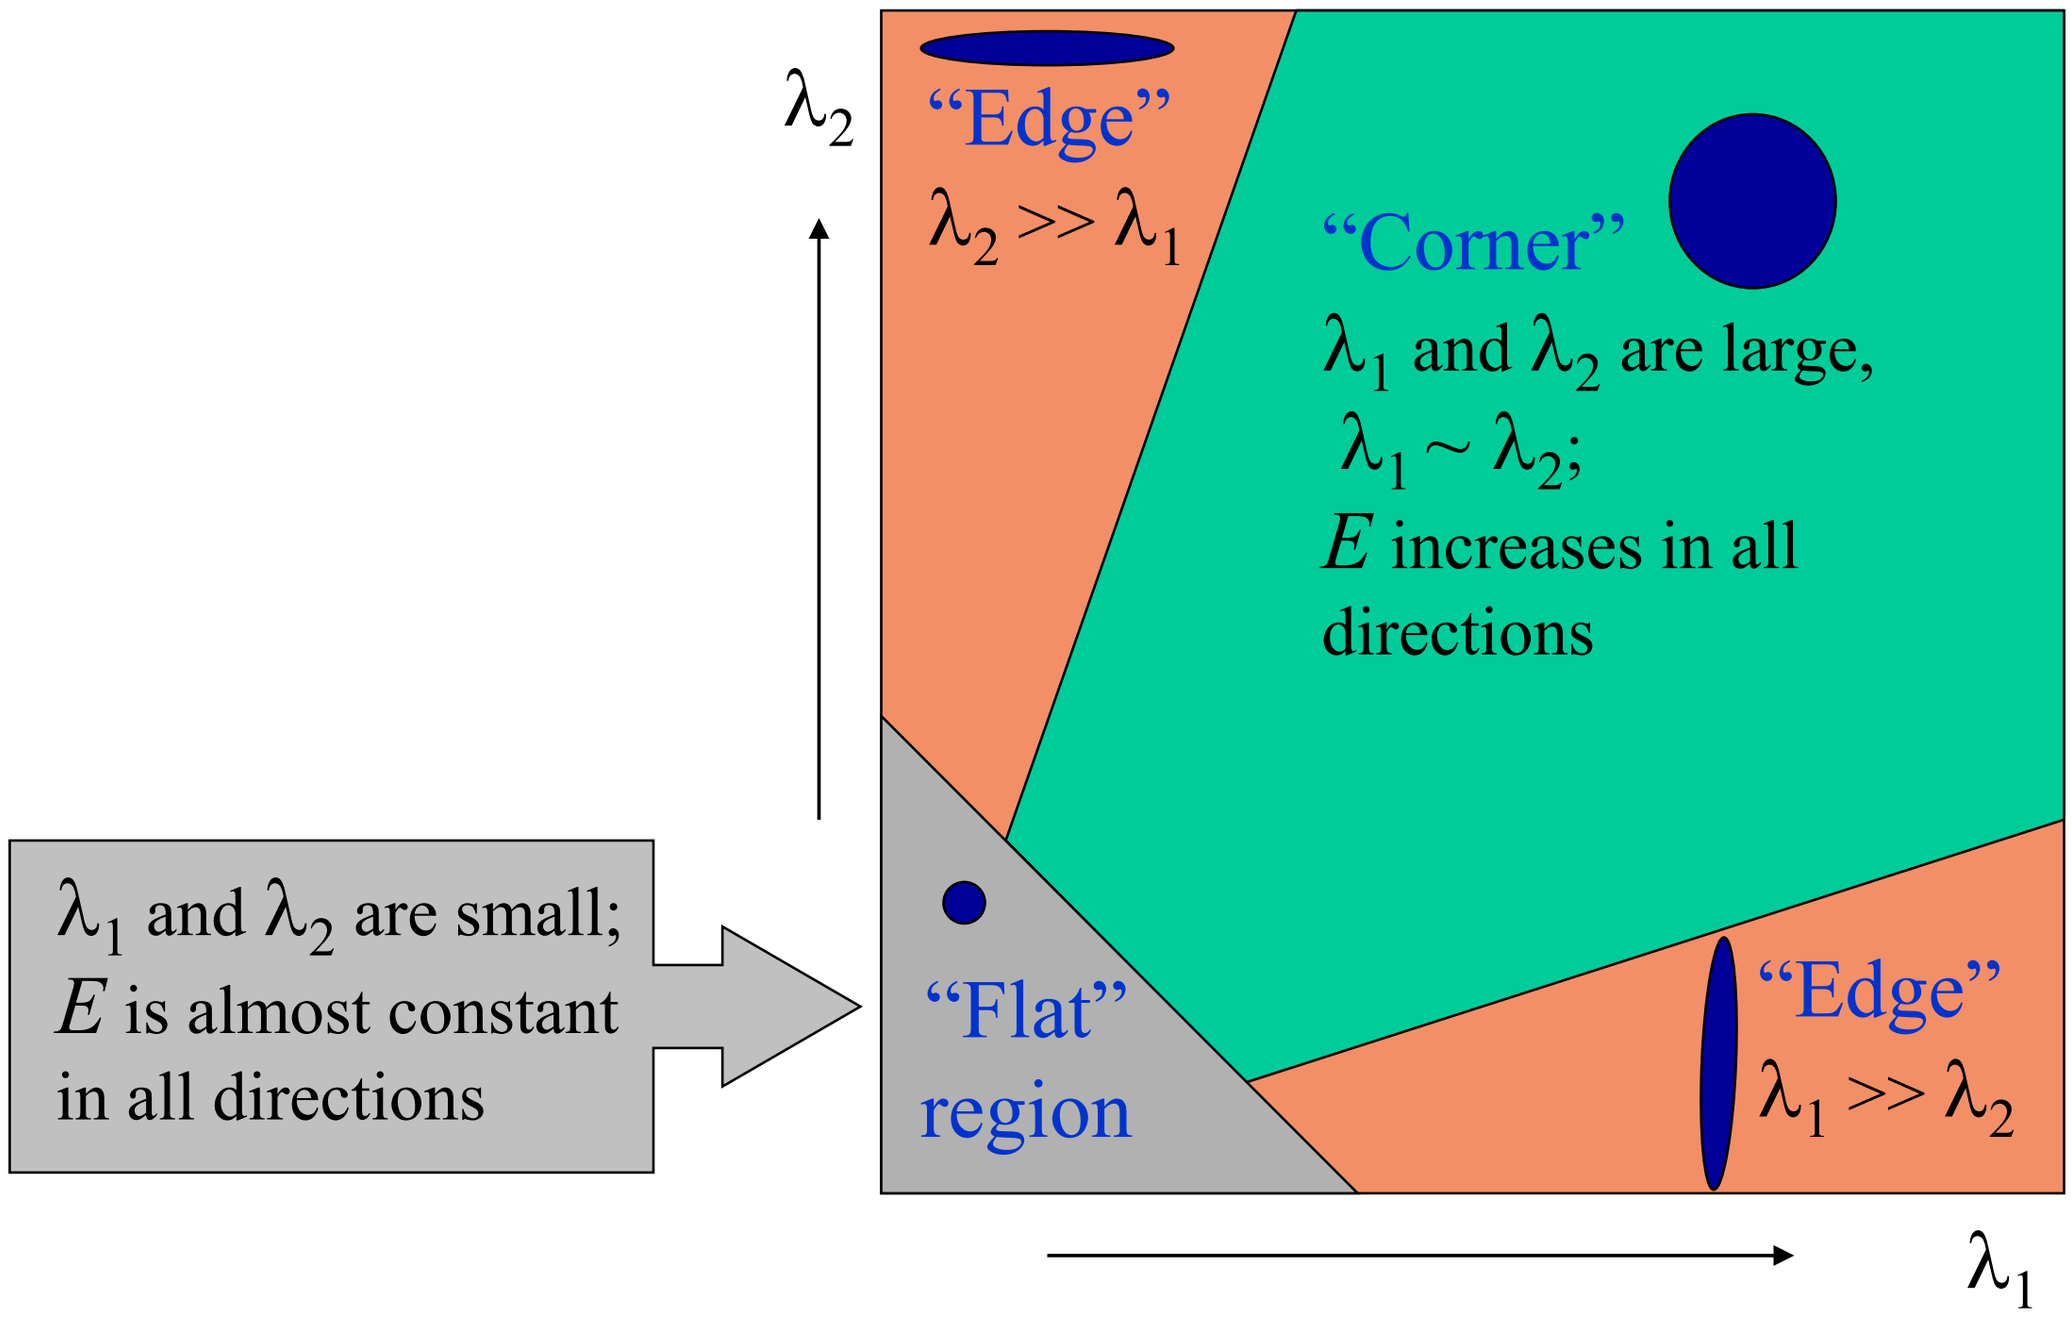
This is the equation of an ellipse.

Diagonalization of A: $A = R^{-1} \begin{bmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{bmatrix} R$

The axis lengths of the ellipse are determined by the eigenvalues, and the orientation is determined by a rotation matrix R.



Classification of image points using eigenvalues of *M*



Source: Deva Ramanan

Efficient computation

Computing eigenvalues (and eigenvectors) is expensive

Turns out that it's easy to compute their sum (trace) and product (determinant)

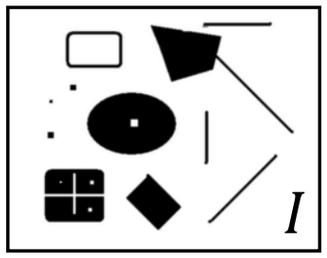
- $\text{Det}(A) = \lambda_{min}\lambda_{max}$
- $\text{Trace}(A) = \lambda_{min}+\lambda_{max}$ (trace = sum of diagonal entries)

$$R = 4\frac{Det(A)}{Trace(A)^2}$$ (is proportional to the ratio of eigvenvalues and is 1 if they are equal)

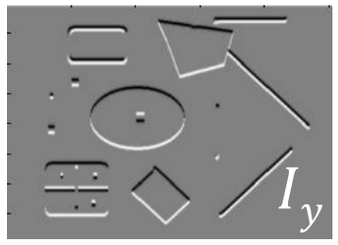
$$R = Det(A) - \alpha Trace(A)^2$$ (also favors large eigenvalues)

Source: Deva Ramanan

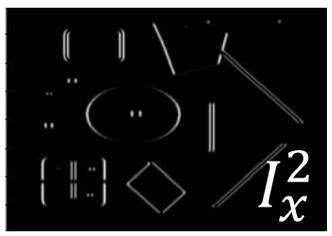
Harris Corner Detector [Harris88]

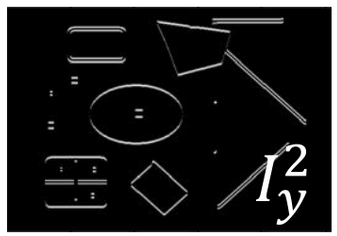


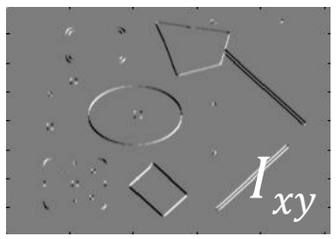
0. Input image
   We want to compute M at each pixel.



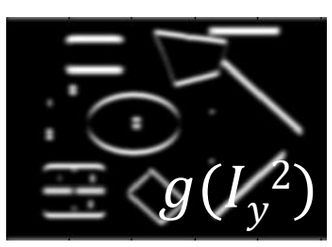
1. Compute image derivatives (optionally, blur first).

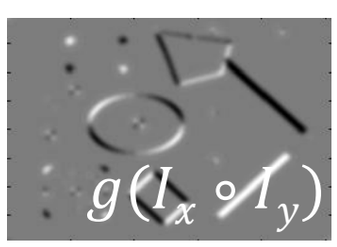






2. Compute M components
   as squares of derivatives.





3. Gaussian filter *g()* with width σ

4. Compute cornerness

$$C = \det(M) - \alpha \operatorname{trace}(M)^2$$

5. Threshold on C to pick high cornerness

6. Non-maxima suppression to pick peaks.

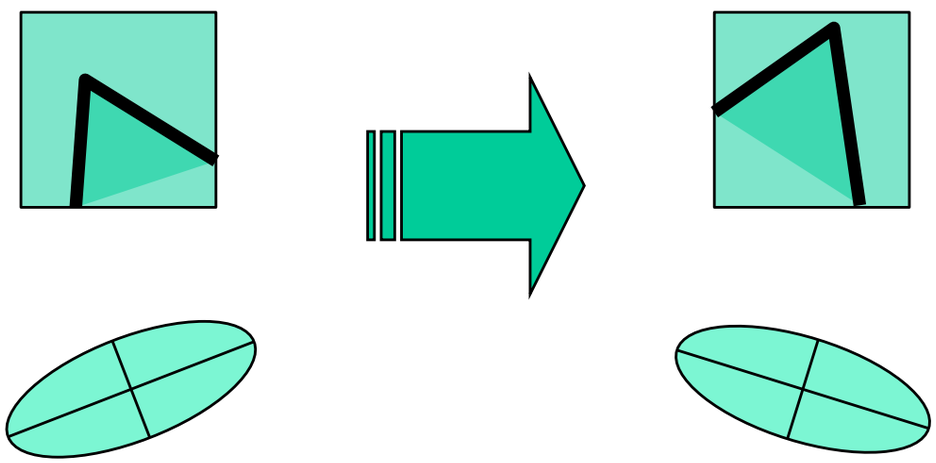
Scale and rotation invariance

Will interest point detector still fire on rotated & scaled images?

Source: Deva Ramanan

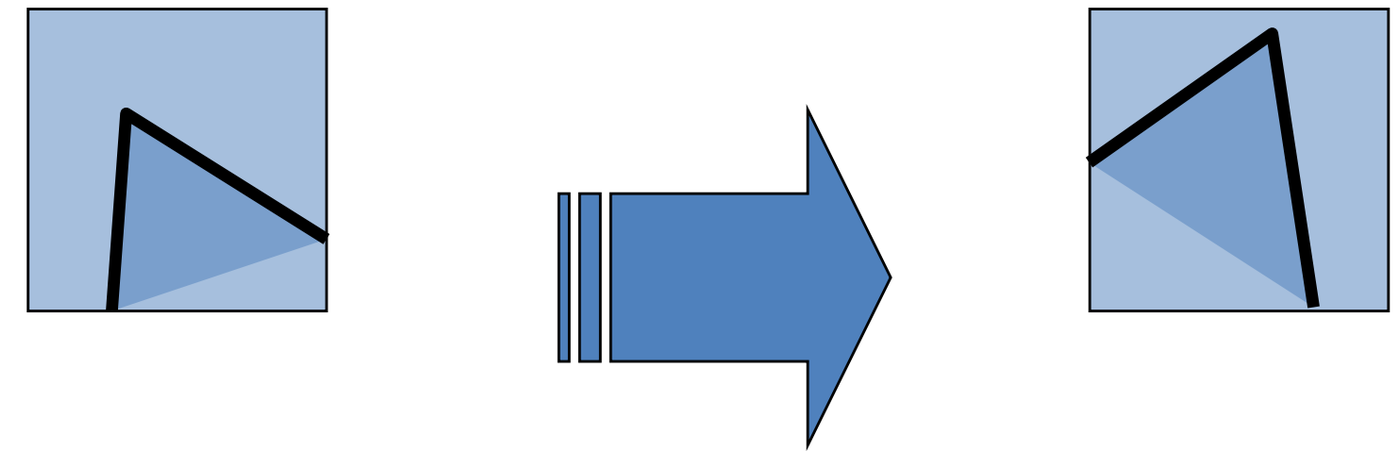
Rotation invariance (?)



Are eigenvector stable under rotations?
Are eigenvalues stable under rotations?

Source: Deva Ramanan

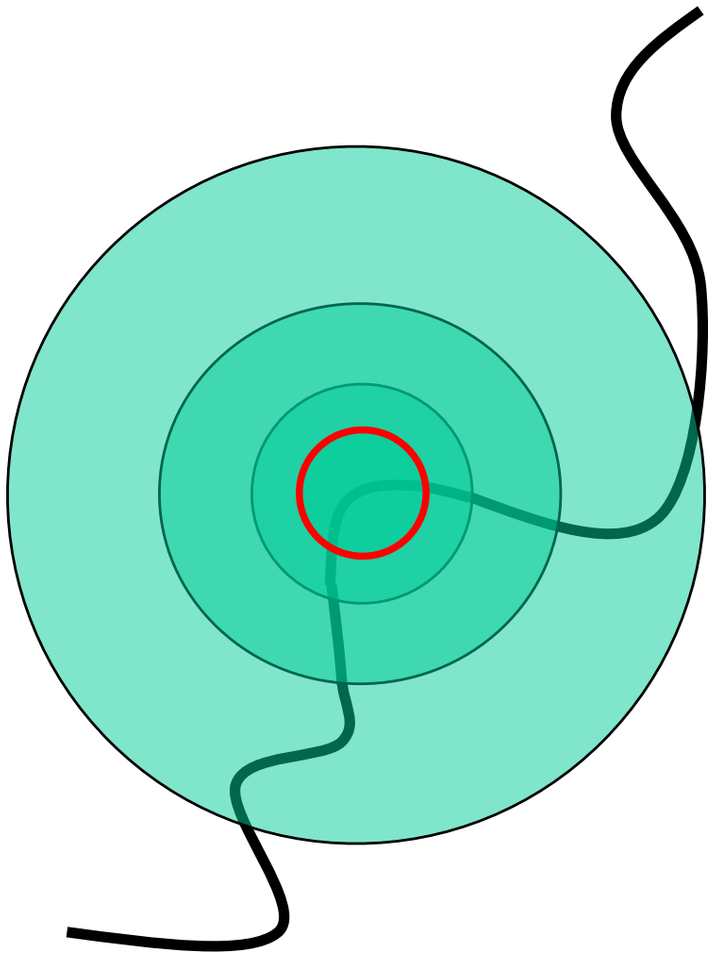
Image rotation



Second moment ellipse rotates but its shape (i.e., eigenvalues) remains the same.

Corner location is covariant w.r.t. rotation

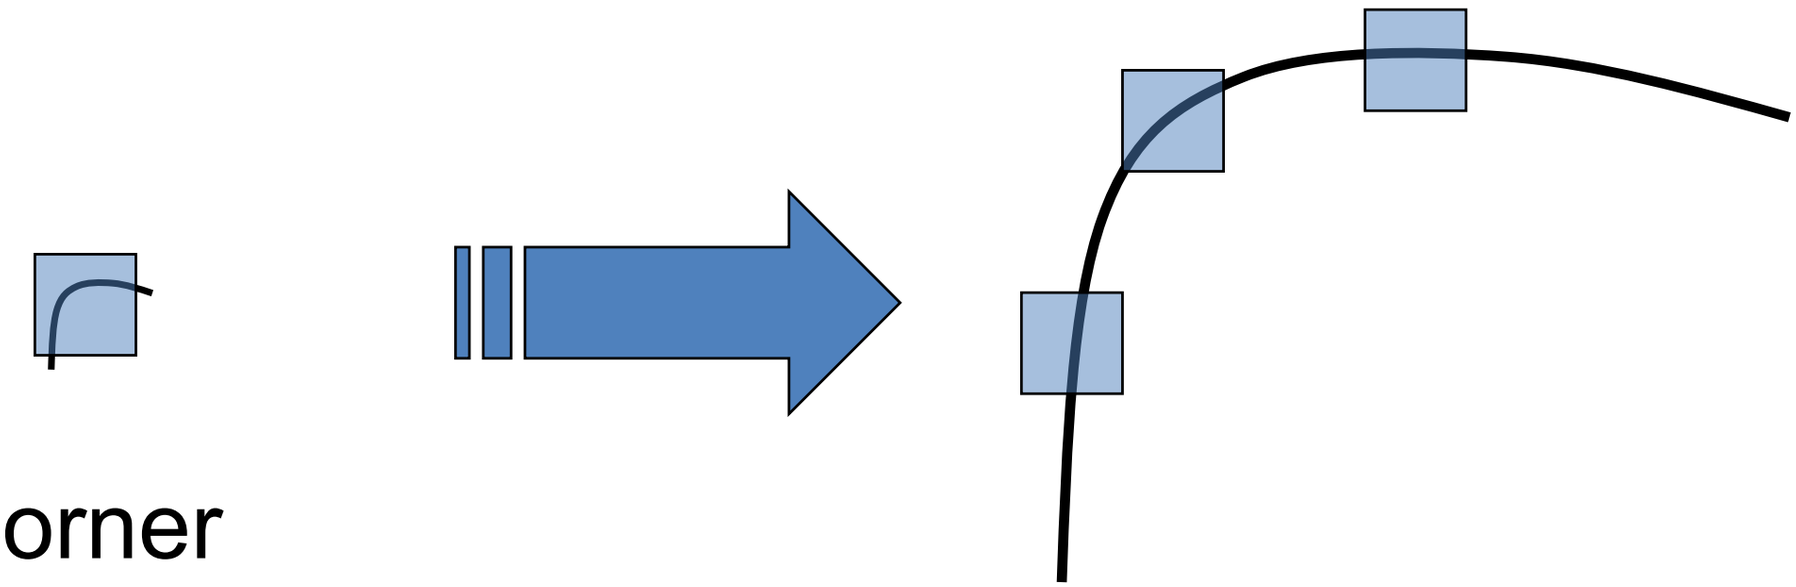
Scale invariance?



Are eigenvector stable under scalings?
Are eigenvalues stable under scalings?

Source: Deva Ramanan

Scaling



Corner

All points will be classified as edges

Corner location is not covariant to scaling!

Automatic Scale Selection

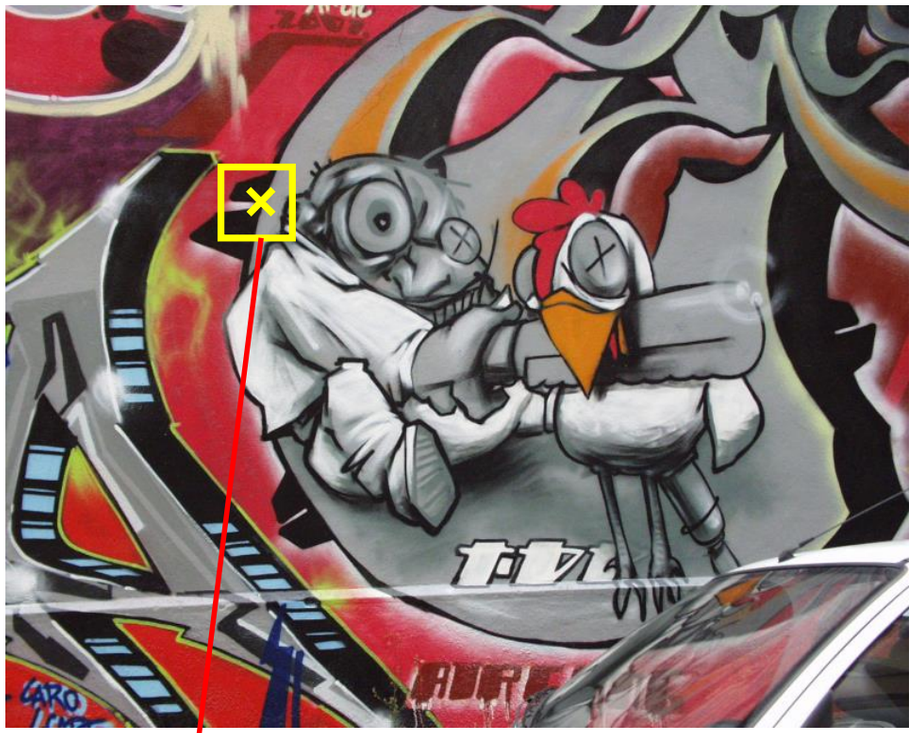
$$f(I_{i_1 \ldots i_m}(x,\sigma)) \;=\; f(I_{i_1 \ldots i_m}(x',\sigma'))$$

How to find patch sizes at which *f* response is equal?

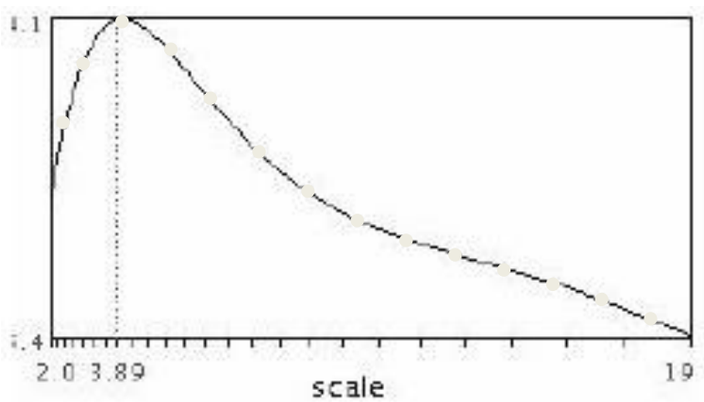
What is a good *f* ?

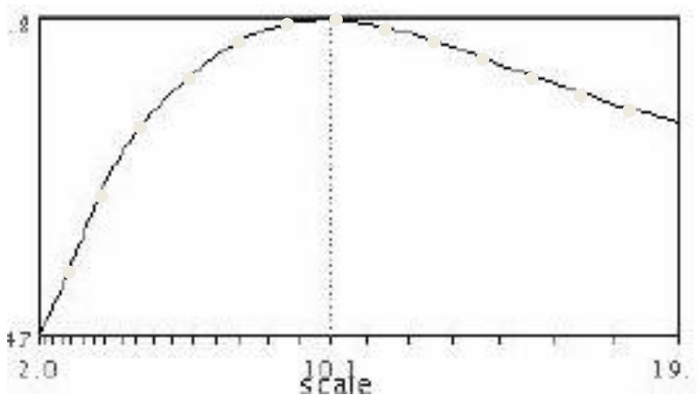
Automatic Scale Selection

- Function responses for increasing scale (scale signature)



Response of some function *f*





$f(I_{i_1 \ldots i_m}(x,\sigma))$

$f(I_{i_1 \ldots i_m}(x',\sigma'))$

K. Grauman, B. Leibe

What Is A Useful Signature Function *f* ?

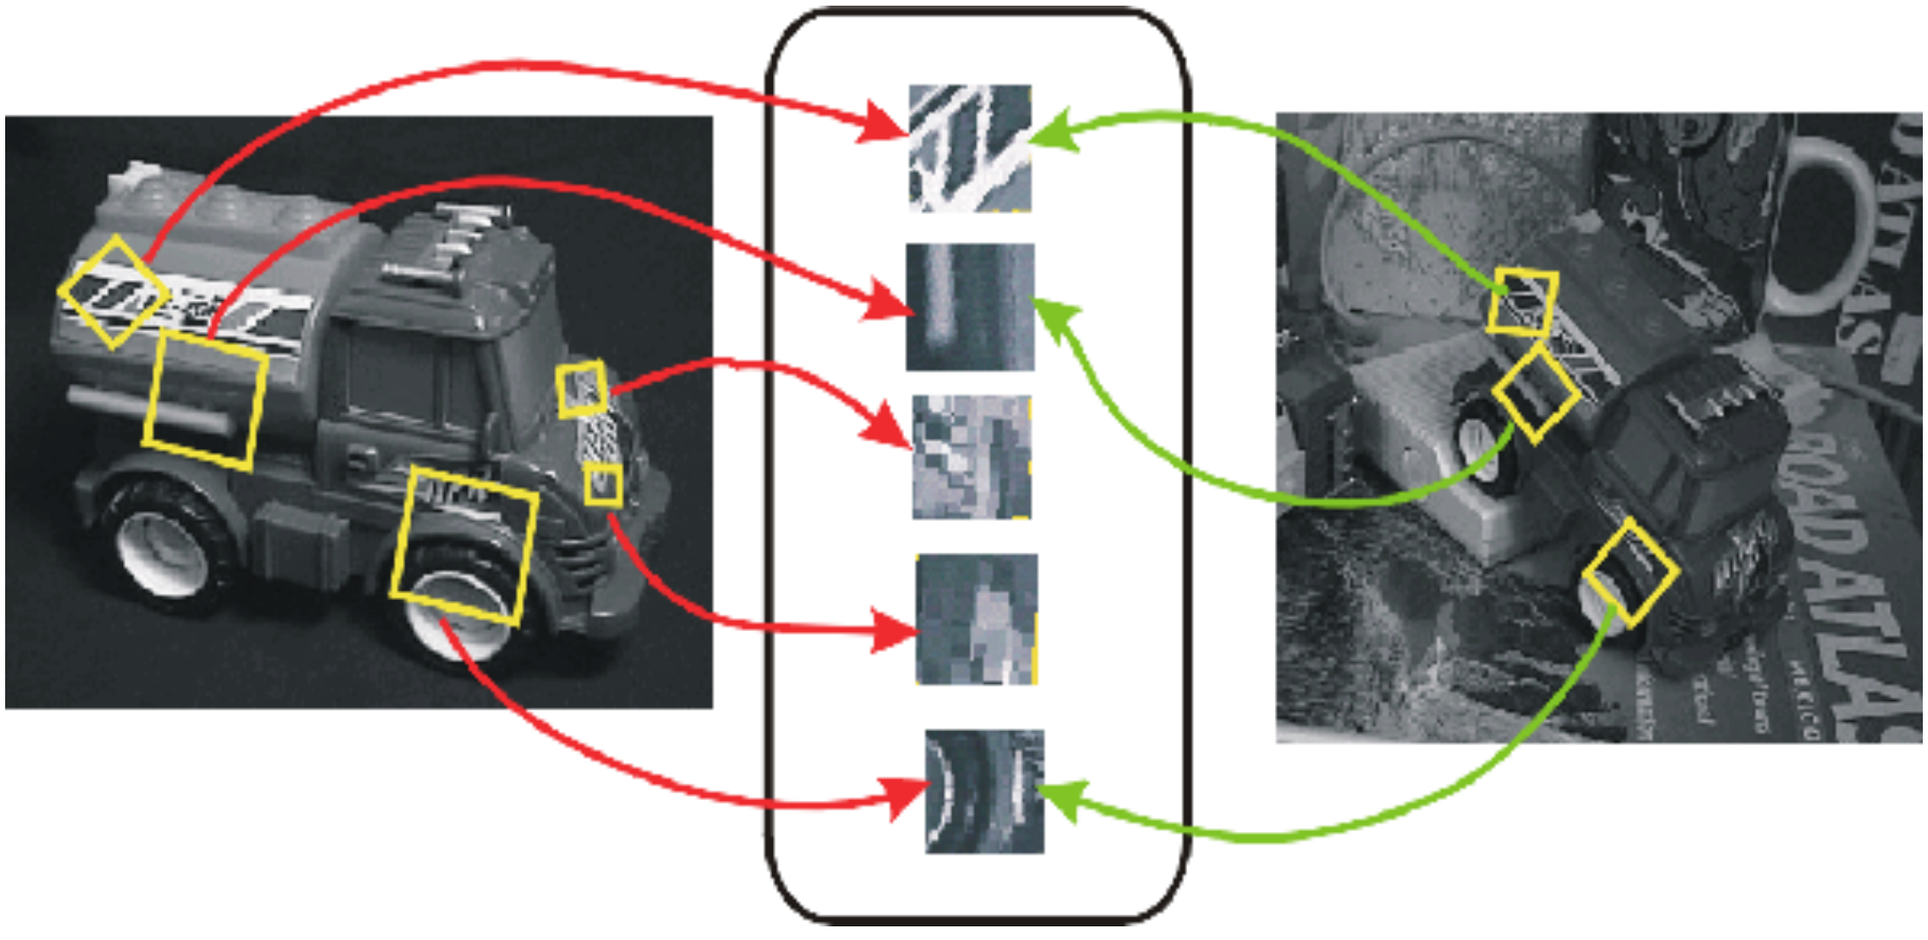
Coordinate frames

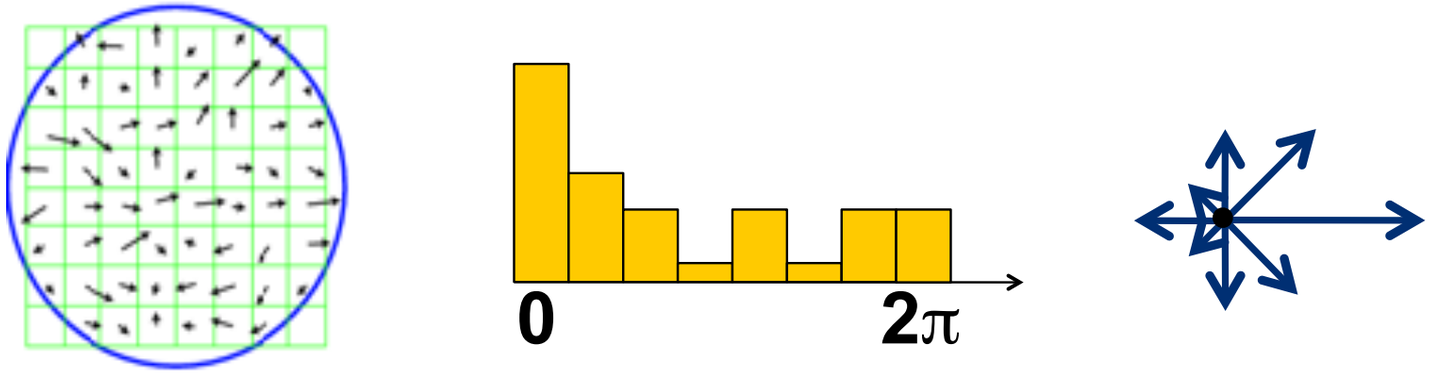


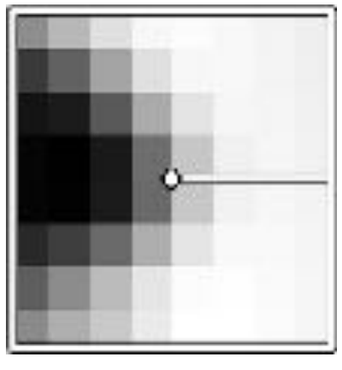
Represent each patch in a canonical scale and orientation (or general *affine* coordinate frame)

Source: Deva Ramanan

Find dominant orientation

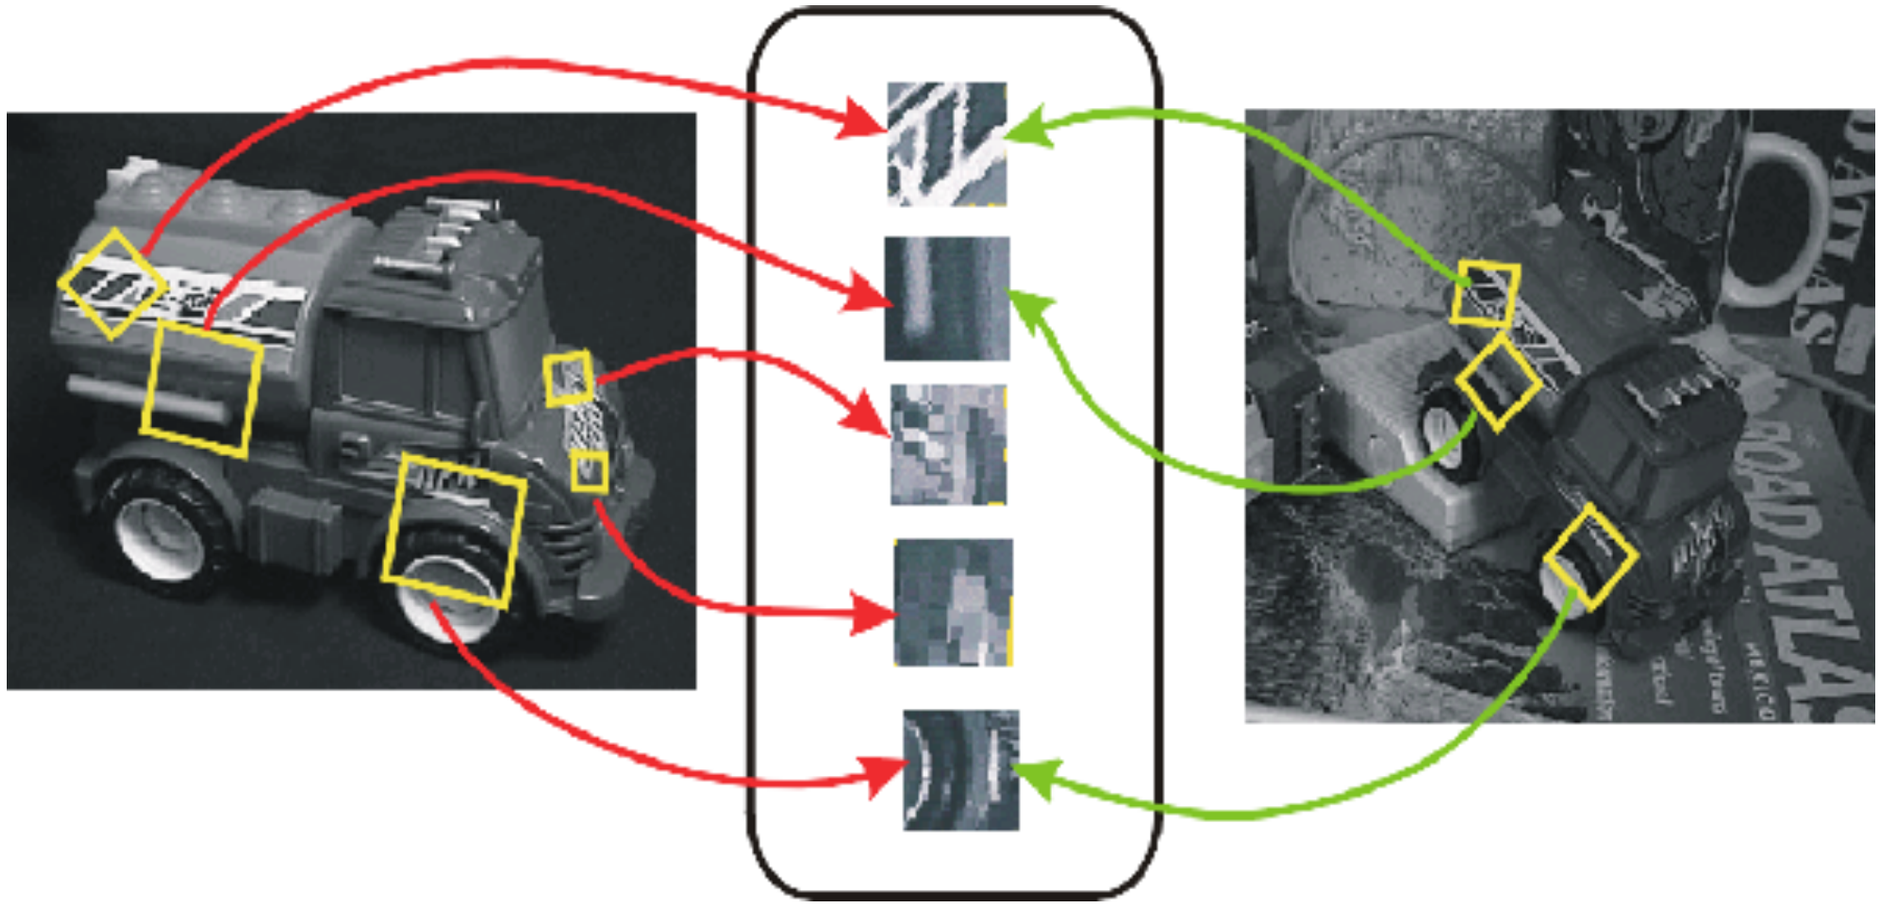
Compute gradients for all pixels in patch. Histogram (bin) gradients by orientation





Source: Deva Ramanan

Appearance descriptors



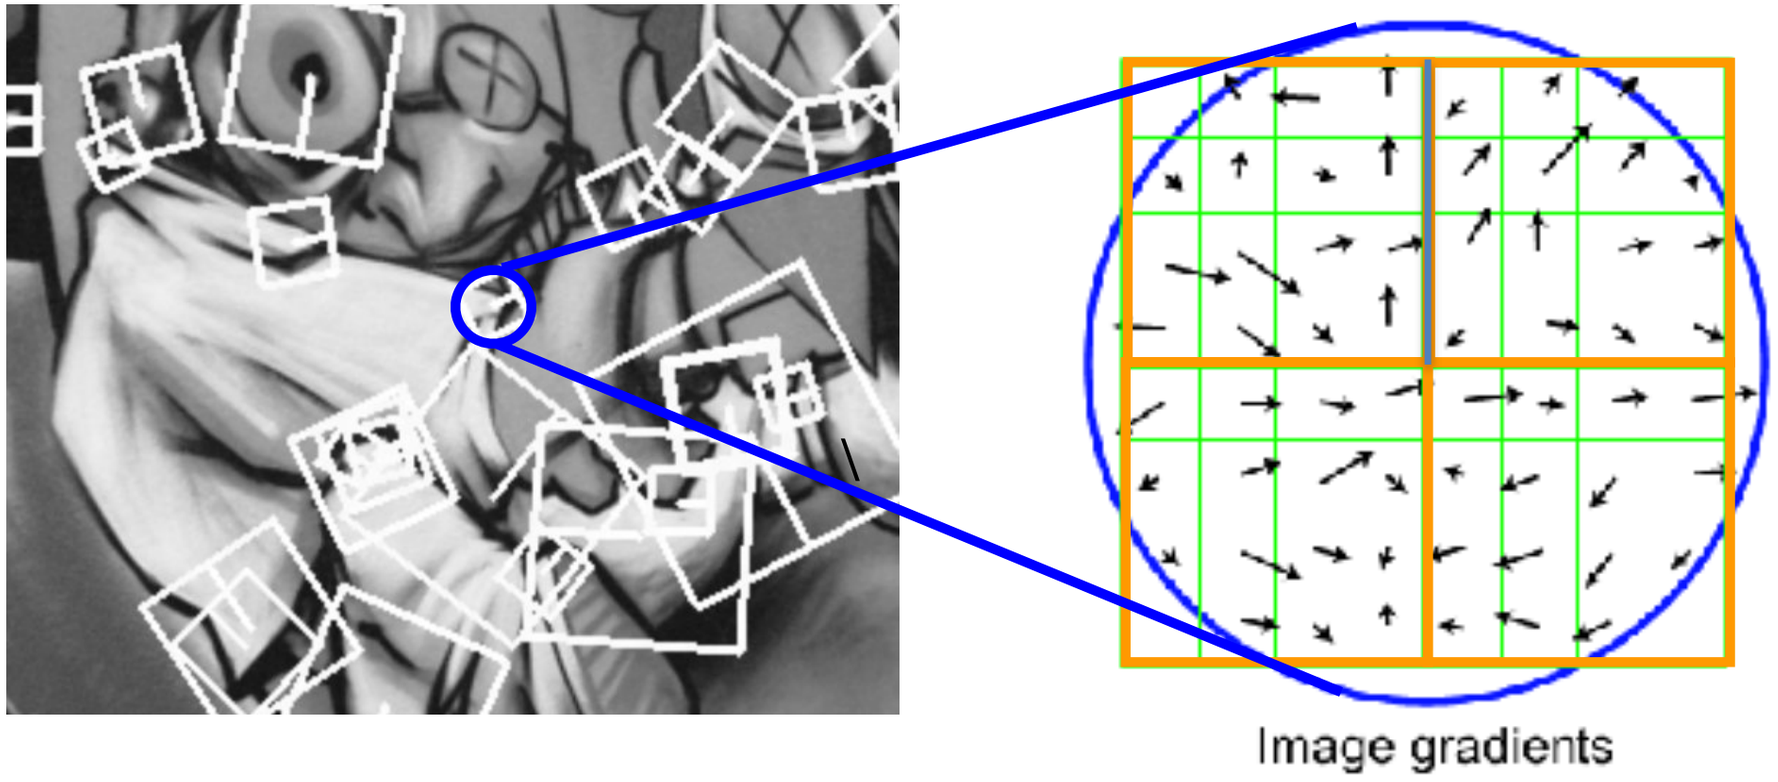
Represent each patch in a canonical scale and orientation (or general *affine* coordinate frame)

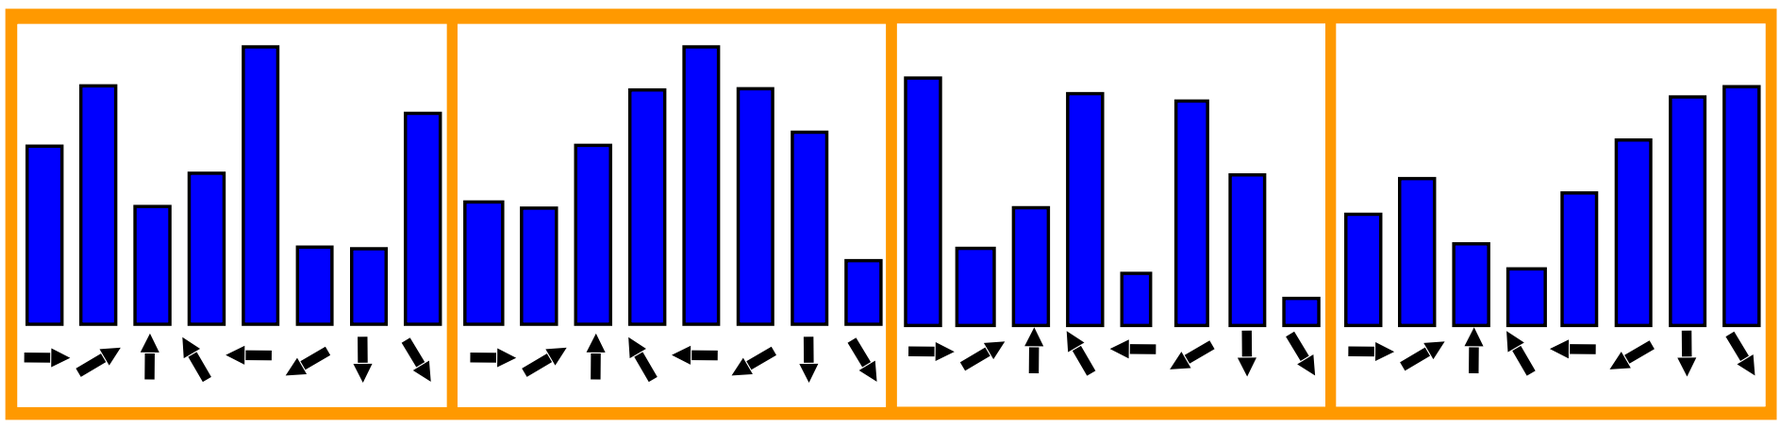
$$d(p_1, p_2) = \left\| \begin{bmatrix} \cdot \\ \cdot \end{bmatrix} - \begin{bmatrix} \cdot \\ \cdot \end{bmatrix} \right\|$$

Source: Deva Ramanan

Computing the SIFT Descriptor

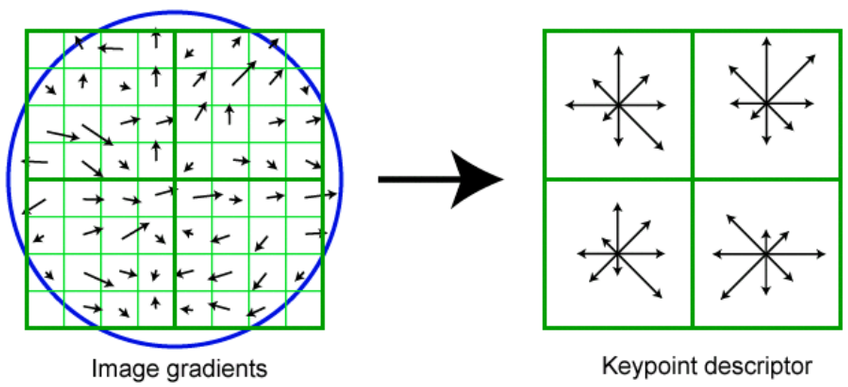
Histograms of gradient directions over spatial regions





Source: Deva Ramanan

Post-processing



1. Rescale 128-dim vector to have unit norm

$$x = \frac{x}{||x||}, \quad x \in R^{128}$$

“invariant to linear scalings of intensity”

2. Clip high values

$$x := \min(x, .2)$$

$$x := \frac{x}{||x||}$$

approximate binarization allows for for flat patches with small gradients to remain stable

Source: Deva Ramanan

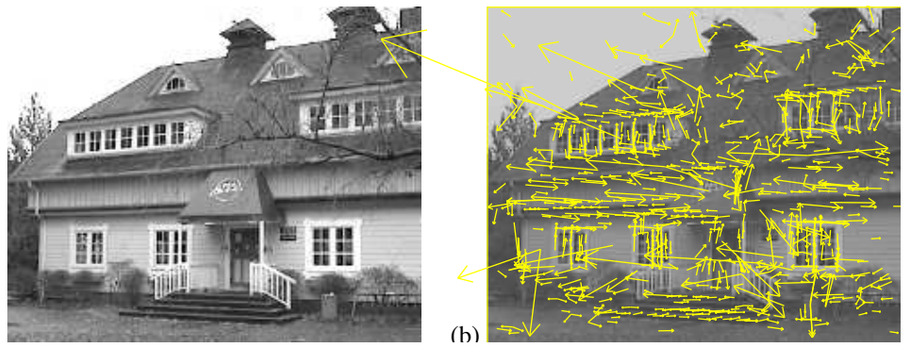
Evaluation

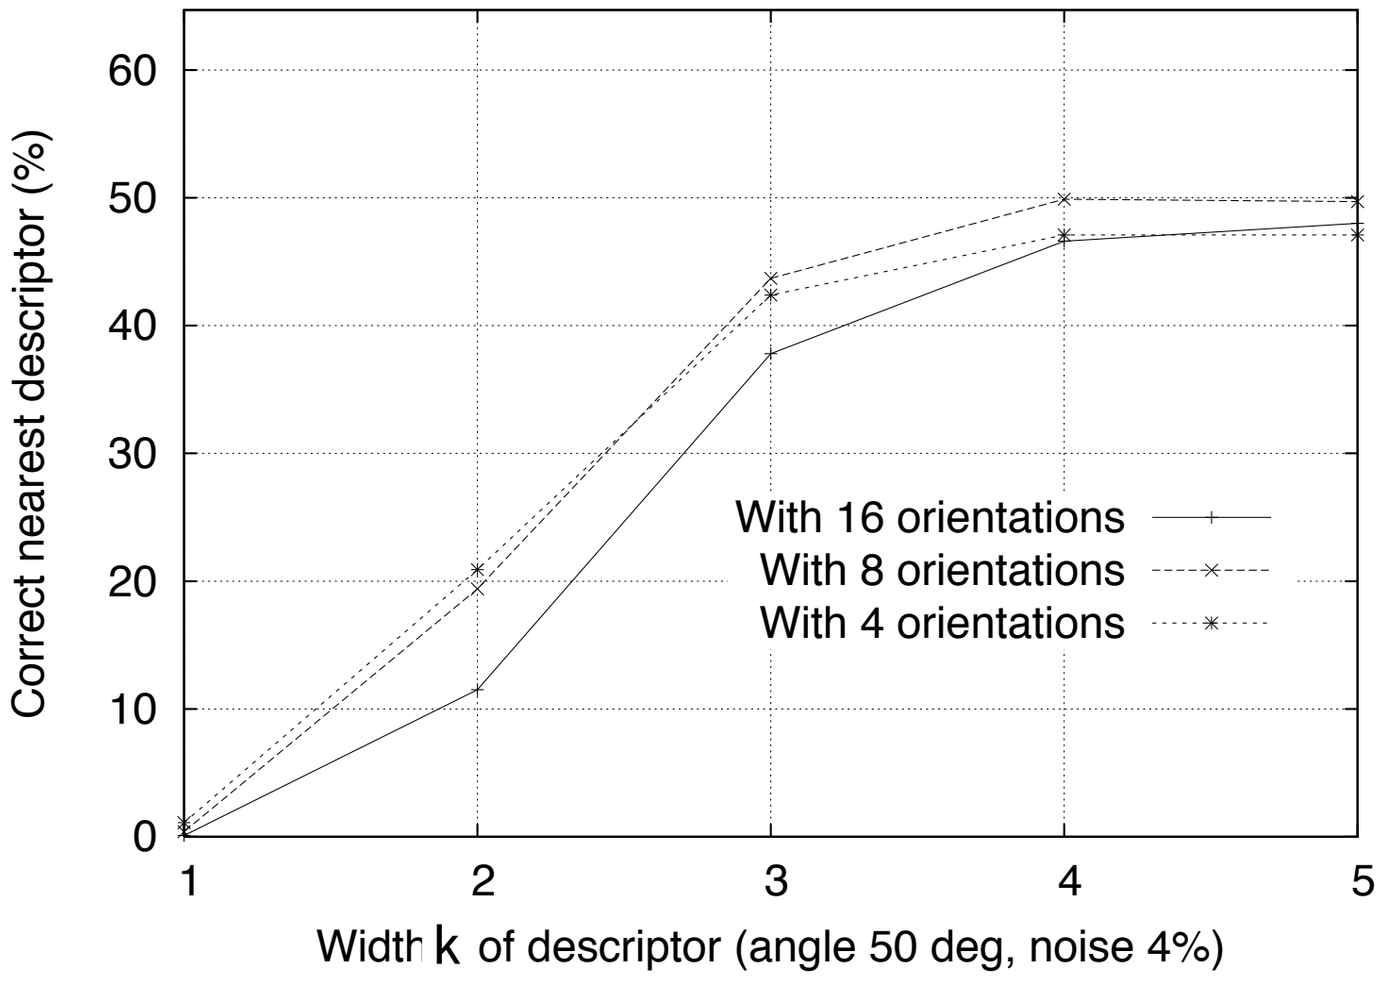
Historic problem in computer vision:
“wide-baseline matching”

Source: Deva Ramanan

SIFT

What made this work? Exhaustive evaluation of hyper-parameters on annotated dataset





Source: Deva Ramanan

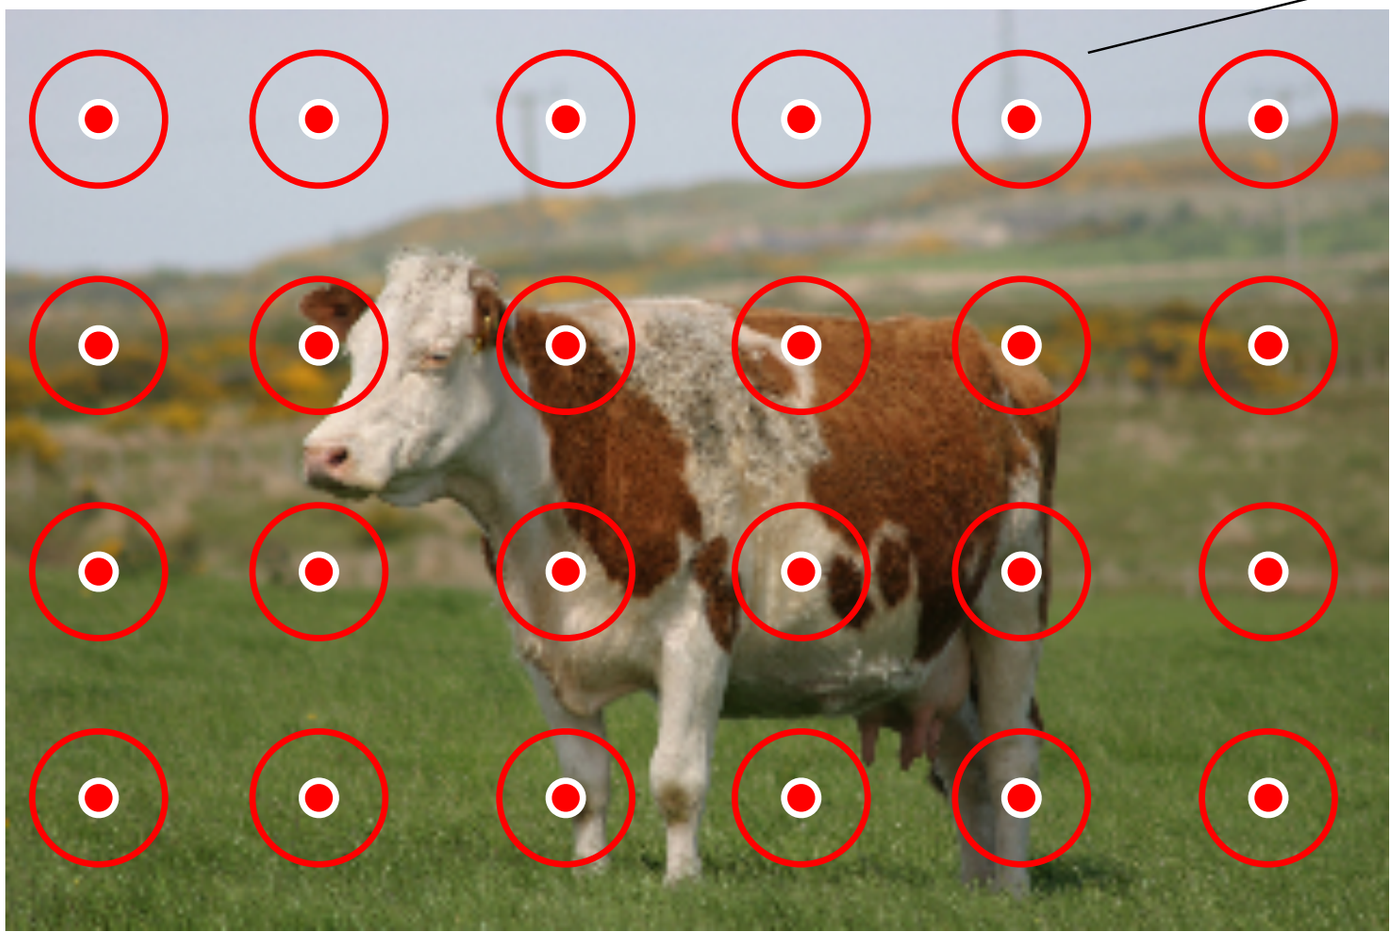
Properties of SIFT

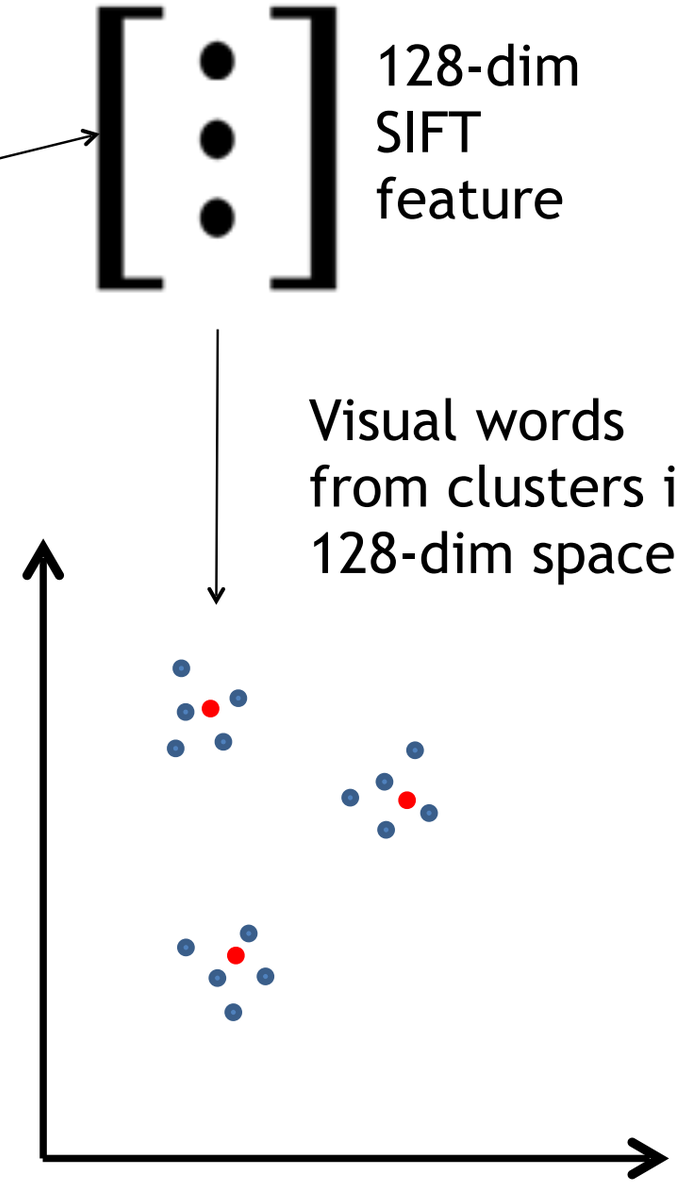
Extraordinarily robust matching technique

- Can handle changes in viewpoint
  - Up to about 60 degree out of plane rotation
- Can handle significant changes in illumination
  - Sometimes even day vs. night (below)
- Fast and efficient—can run in real time
- Lots of code available
  - http://people.csail.mit.edu/albert/ladypack/wiki/index.php/Known_implementations_of_SIFT

Dense sampling

- So far: Descriptors of patches centered at sparse interest points
- But we can use the descriptors at any point
- Common case:
  - Regularly sampled grid of points
  - Dense SIFT (or LBP, or…)



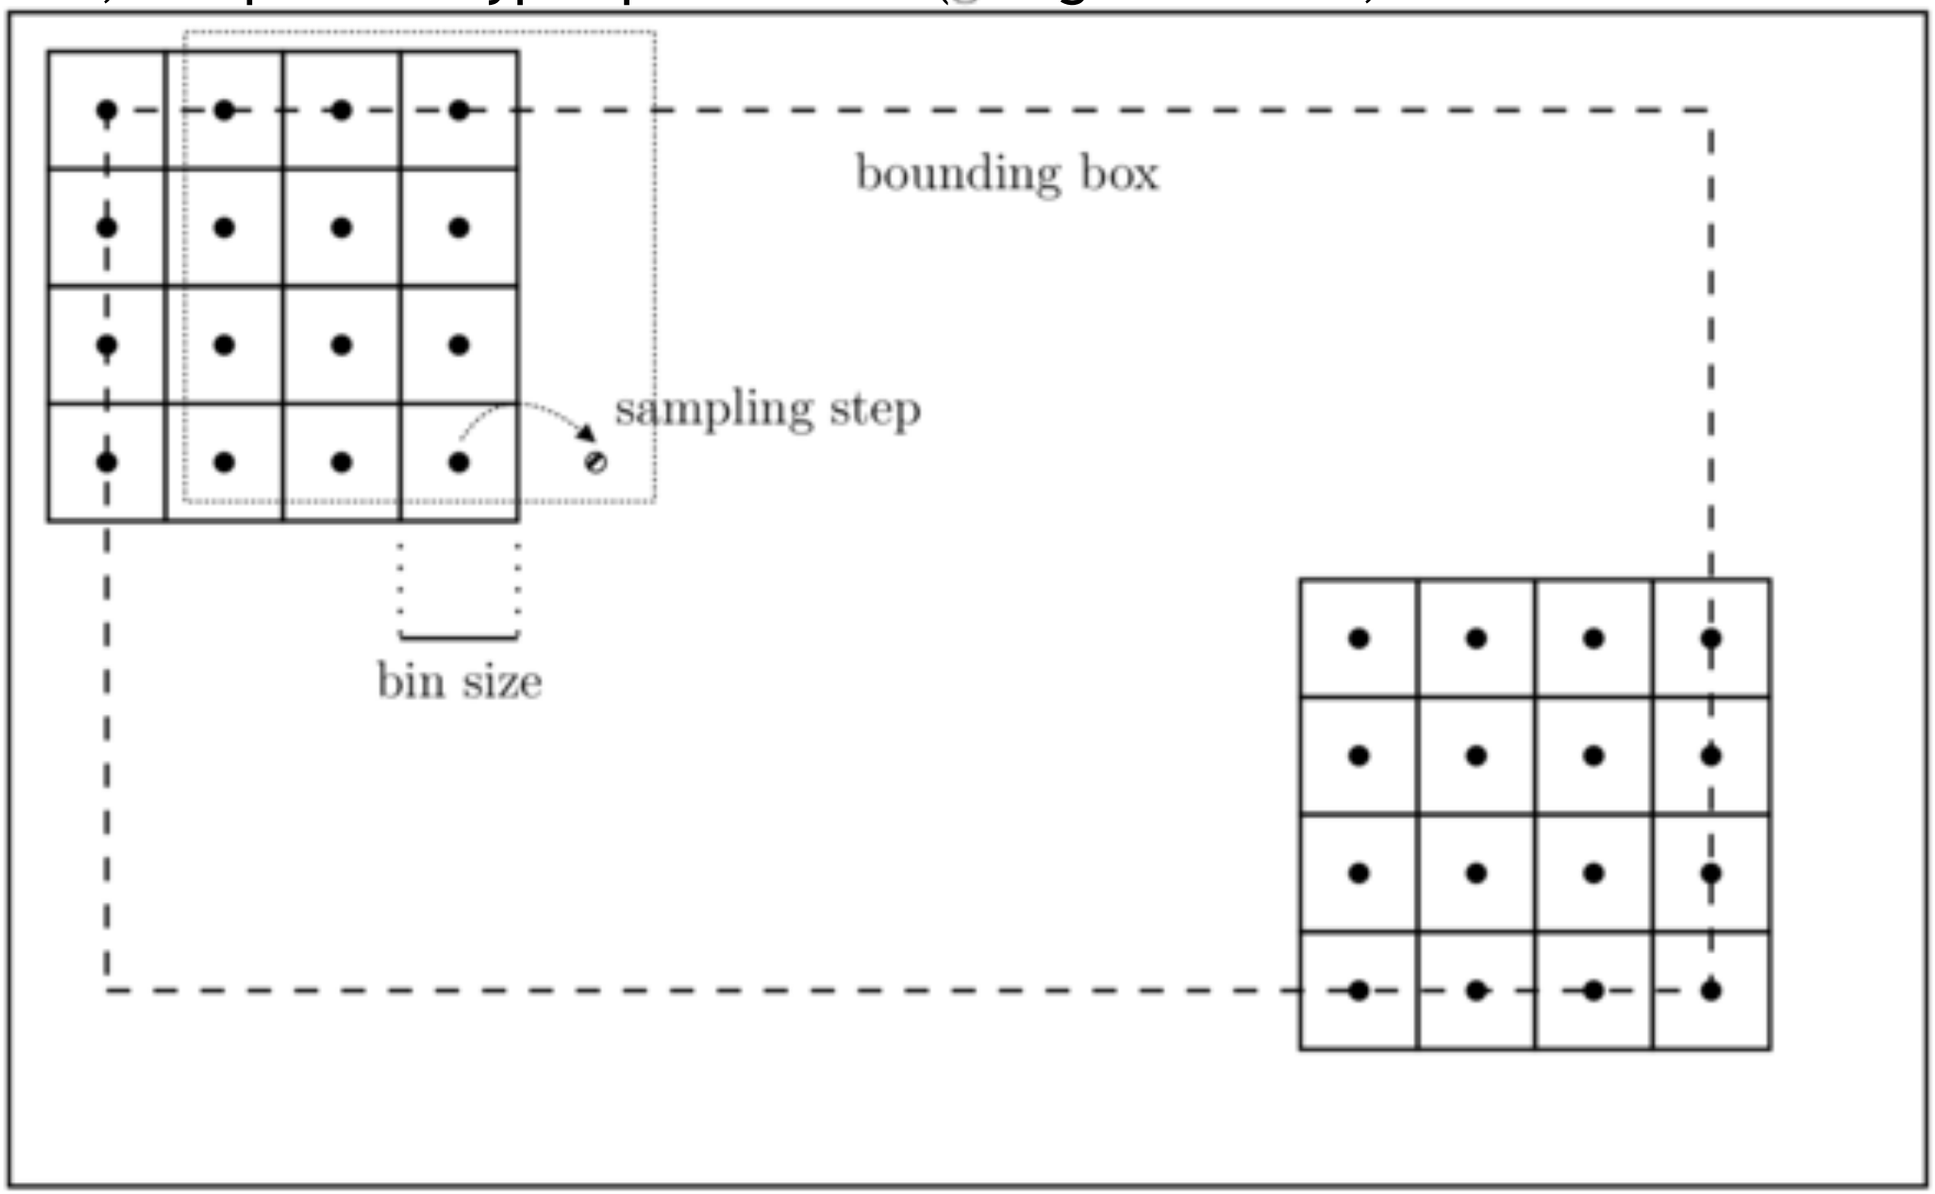


Source: Deva Ramanan

HOG

Compute SIFT descriptors on a grid equal to size of individual “cell”

In practice, re-optimize hyper-parameters (2x2 grid of cells, with each cell of 8x8 pixels



Source: Deva Ramanan

Common visualization
